PUBLISHERS' DEPARTMENT....

#### OREST TREAM

NEW YORK, THURSDAY, AUGUST 5, 1880.

OUR MIDSUMMER NEW YEAR.—The register at the head of this page marks the first number of a new volume, and this journal to-day enters upon the eighth year of its publication.

We are duly gratified at attaining this maturity, and express our satisfaction in a substantial manner by a change for the better in make-up and the adoption of a superior grade of paper. These improvements, with the others which have been introduced within the last six months, now make the Forest and Stream a model in its mechanical execution.

If we may credit the many kind words of our friends and the evidence afforded in the decided indorsement of a stanch patronage, the paper is also growing apace in he value of its contents.

That the Forest and Stream has succeeded in adaptg itself to the wants of the gentlemen sportsmen of merica, and is in turn supported and indorsed by them, highly satisfactory, and is complimentary to all conraed, for it is proof positive of two things—first, of the isdom of the management of the paper, and second, of good taste of the sportsmen.

VERTISEMENTS.—Advertisers are respectfully sted, in all cases where it is possible, to send in their vertisements by Saturday of each week before the issue which they wish them to appear. We cannot receive w advertisements, nor make changes in those already unding, later than Tuesday morning.

-The portrait of Greene Smith, which we had hoped publish this week, has been unfortunately delayed, we are, therefore, reluctantly compelled to defer it itil our next issue.

#### THE NEW GAME AND FISH PROTEC-TORS.

S EVERAL amendments to the game law of the State of New York were proposed last winter, but only one act among them received the signature of the Governor and became a law. As a rule, changes in our game laws are too frequent to be thoroughly learned by the people at large before they are modified or entirely su-perseded by others, and in many cases this frequent tinkering is a worse evil than no law at all, causing many people to despair of comprehending or remembering the ever-changing clauses of the laws, and almost rendering it necessary for a sportsman to carry a copy of the Revised Statutes with him into the field before he dare wet a line or pull a trigger. The practice of having different laws or different close seasons for fish and game in adjoining counties, is often the cause of much unwitting violation of the law by those who are ignorant of such difference; but the main trouble has been not so much in the law itself as in its lack of enforcement, dependent, as it has been, upon clubs, societies and individuals, who were either actuated by public spirit or a desire for gain, former laws having a provision allowing the informer or prosecutor to receive a portion of the penalty imposed upon the transgressor-a clause which rendered the complainant liable to the suspicion of mercenary motives, and often invested the offender with the sympathy of his neighbors as a persecuted man.

It is a fact well known to all who have watched the

workings of the game laws, that the local constables are not to be depended upon to prosecute their friends or townsmen for an offense which is to them a venial one. and in the eyes of too many others one to which no moral guilt is attached.

It is to be hoped that the officers appointed under the new law will prove to the poachers and unprincipled marketmen that the game law is not a dead letter. This law, which was very carefully framed by Mr. John E. Devlin, of New York City, provides for the appointment of eight officers, to be known as Game and Fish Protectors, who are to have full power to enforce the laws and arrest all offenders, and in order to secure a good class of men in these positions, no share in the penalties is offered, but instead of this a salary is given. We understand that the appointments are made, but the list has not reached us yet, and with the right men, who will do their duty fearlessly, there is a prospect that the laws which have been defied so long will now be enforced.

These protectors will be charged with the duty of en-

forcing all statutes for the preservation of moose, deer, birds and fish, or other game laws, and to bring, or cause to be brought, actions and proceedings in the name of the people of the State, against all offenders. They are to be appointed by the Governor, and will hold office for three years from the date of their appointment. Section 1 provides that the district attorney of any county in the State shall, upon the request of any one of such protec tors, commence and prosecute to termination, action against any person reported to him by such protector to have violated any of these laws. Section 2 provides that any net, pound, or other means or device for taking fish which is set in violation of existing laws, is declared a nuisance, which may be abated by any citizen, and the protectors, if applied to, must seize and remove it. Section 3 gives the protectors authority to arrest persons violating any of the provisions of any statute now or herenfter enacted for the protection of fish and game without the formality of a warrant.

For these services the protectors are to receive a salary of \$500 per year, and traveling expenses not to exceed

We hope for a better enforcement of the existing laws under this new regime, and shall watch it with great interest, and think that at least one of these protectors should be located in New York City, to watch kets, which are the great inducement to the market poacher to violate the law. Destroy his chance of profit and his desire to shoot or net illegally is gone, and we do not think that it would be an exaggeration to say

that one-fourth of all fish and game which is unlawfully killed within the settled portions of the State finds its way to the markets of the great city.

#### COL. BODINE'S IRISH VICTORY.

"HE return of Col. Bodine and his explanations of his work and the work of his team in Ireland adds the emphasis of an official sanction to what the Forest and Stream has already given in the regular reports of the match. With more details about the weather conditions, the effort of the six men who added another defeat to Irish rifle history only appears the more brilliant. On such a day the score of the Irish team shows that the men have fully mastered the problem of wind judgment, while on behalf of the Americans it must be said that they are entitled to a credit fully up to that accorded any previous team.

The Irish riflemen, more than at any of the preceding matches, had a clear anticipation of success; they had, by their successive defeats, arrived at a very distinct understanding of the strength of the American team shoot-Every little incident and contributory element of strength had been carefully gauged, and such sharp watchers as the Rigbys, Milner and Fenton had taken in the points which in their opinion helped to the line of victories which the Creedmoor men have enjoyed. Americans have not been reticent at all in proclaiming the secrets of their victories. Everything has been set out in the plainest of terms, so that American riflemen, while leading the world, have not made a mystery of their craft. For a time the Irish ridemen did not heed the lesson. They did not seem to comprehend the proposition that the strength of a well organized team is far ahead of the mere total of the strength of its individuals. The old muzzle-loaders, once the weapon beyond comparison at long range, was clung to in spite of the overwhelming proof of each match that the American makers had united accuracy with convenience in their The proof of their error was too strong breech-loaders. for the most conservative of Irishmen or Englishmen to withstand, and with a prospect of an unlimited series of annual whippings before them if they persisted in their antiquated methods, the Messrs. Rigby decided on a change. First came the change in the position when firing, in the adoption of the back-position, which is now the universal position for long-range work. In the several years of quiet which have elapsed since their last match at Creedmoor, the Irish have been hard at work, and when the invitation of this spring was sent out they were prepared to reap the victory they anticipated from Irish labor and Anterican listlessness. But while the shooters on this side the water had done little or But while nothing in the way of showing their skill, they had lost none of their cunning, and with a good reasoning of that indefinable element—luck—another leading score was put on record.

Col. Bodine may do a good service for riflemen or, this side by giving, in his written and formal report, a careful survey and estimate of the several points in which the Irish riflemen have added to their strength, and wherein our chances of continued success now Lie. One thing is certain, that from this time on rone but the most perfectly organized teams should be permitted to go forth as representative ones. From what Col. Bodine says, and from what he Lignificantly omits to say, it is pretty certain that he had much crude strength and much discordant material in his team; but he had the backbone and the good sense to determine, when it came to a choice between discipline and defeat, to choose the former. The best the discomfited ones can say is that he might possibly have had a stronger team. It is hardly probable that he would. The good men of his squad did all that was expected of them, the weak men more, and and so the fight was won. A priori, we should say that the omission of Capt. Jackson from the shooting six was a mistake. There may have been some element of partiality and personal feeling entering into the omission, as is claimed in some quarters; but it must be conceded that the right of judgment was given to Col. Bodine and that this fact was known to all members of the team long before they began shooting for places on the The proper feeling among all the team men should have been a complete abnegation of self. They were sent to conduct a campaign on behalf of America generally, and this object having been gloriously accomplished, it will be very difficult indeed to make the people of America believe that there was any very grievous error committed by Col. Bodine in making up his team. Somebody's corns may have been stepped on, but the public cannot be expected to cry thereis. Tl.o lafe American team leader may not be an immaculate Solon. but he certainly has been a creditable con mander, and those for whom he fought and won will not be very curious to go behind the returns. If any positive injustice has been done any one, the Forest and Stream will do all in its power to expose such ill-doing; but our columns cannot be made the vehicle of indefinite abuse Until somebody can show us that Col, Bodine did not win the match at Dollymount, we must be excused in our be lief that it was the men who shot and not the men on the reserve who carried the day.

#### THE ANTHRACITE DECLINES.

THE challenge to the Anthracite by the Herreshoff Manufacturing Co., of Bristol, has been declined by the agents of the Perkins system on the grounds of "the different size and power of the yachts." We are not aware what claims Mr. Perkins' agents have to being considered engineers, nor that they make any such, but we do know that the excuse offered for not meeting the challenge is a very frivolous one. Everybody knows by this time that there is nothing in America slow enough to make a race in speed with the Anthracite. The work ing speed of the latter seems to be something like six miles, and eight miles is about the best she can do. Our steam barges do better than that; consequently, a race between the English steamer and anything in America was out of the question. But in the test of economy the difference in hull of Leila and Anthracite has no influence whatever, as the engineers aboard the latter could probably have informed the agents. It is a question of producing one horse power at the least consumption of fuel, apart altogether from what the resultant speed of the vessels may be. For that matter, they might both have been tied up to the dock during the trial without in the least vitiating the deductions. The only reasonable condition the Authoracite could have demanded would have been equality in the efficiency of propellers, so as to eliminate differences on that score.

The best recorded performance of the Perkins system is 1.6 pounds, whatever else the originators of the fairy tales now floating about may assert. We have before us the record of 1.9 pounds for a common collier. with ordinary cylindrical boiler and common engines and steam about 80. Given 150 pounds pressure instead, a well-designed engine, and the careful stoking and selected fuel used in test trials, and there can be no question but that the collier would have equalled the Anthracite in economy, to say nothing of steaming around her in circles, which is an irrelevant matter. The Babcock & Wilcox, as well as many other sectional boilers, produce steam inside of two pounds at comparatively moderate pressure, and we have good reason for stating that the Herreshoff coil is quite as economical as the Perkins boiler, besides being far better suited to stand the results of expansion and contraction, easier to repair, cheaper in first cost, lighter and under better control, the range of the gauge being less than a fifth of that even experienced hands aboard the Anthracite require.

It is to be regretted that the Anthracite has refused an excellent opportunity of proving what has been crammed into the space writers of our esteemed daily contempora ries. Her refusal is clearly a case of funk. The British government, in search of just such a boiler for torpedo and launch service, has given the Herreshoff coil the preference, and any one who knows how hard it is for a body of Englishmen to accept an American idea will be able to appreciate this at its full value.

The United States government will probably appoint a board to examine the claims of the Perkins system. trust competent engineers will be put on the board, not rusty, old time skippers. Let the board be composed of men who know enough to detect the difference between clantrap and facts, and we warrant the Perkins system will show up only a clumsy adaptation of ideas much better carried out by others.

ANOTHER PENNSYLVANIA ASSOCIATE men of Butler, Pa., have organized the natv Association for the Protection of Fish officers for the ensuing year being as follows: President, Alex. Russell; Vice-President, Clarence W. Coulter Treasurer, E. D. Colbert: Secretary, E. W. Vogeley. Directors—Chairman, John N. Muntz; Secretary, George W. Zeigler; John S. Campbell. This club, like others recently formed in Pennsylvania, has abundant opportunity for systematic and definite work,

#### BAY SNIPE SHOOTING.

I. -NOMENCLATURE,

"all our proudest lore, Is but the alphabet of ignorance."

UCH has been written about the confusion which exists in the local names of our game birds and animals, and all to little purpose. Notwithstanding the gallons of ink that have been spilled, and the quantities of pens that have been spoiled in urging a general reform in local nomenclature, no steps have been taken looking toward the adoption of the simple and character istic English names which ought to come into use throughout the whole shooting community. A ruffed grouse is still a "pheasant" in the South and West, and a "partridge" in the North and East; and while the "gopher" of the South is a tortoise, the "gopher" the trans-Missouri region is a little rodent nearly allied to the squirrel.

It is evident that we cannot hope in our day to have the language of science come into general use among sportsmen, and, on some accounts, it is not desirable at present, that this change should take place; for, in many departments of biology, the scientific nomencla ture is only provisional and is constantly changing, and a name employed to-day is obsolete to-morrow. These changes, of course, are to be kept up with only by the specialist. It is not possible that the general reader should follow them.

What we now need are simple English appellations for our game animals-names which shall recommend themselves to everyone, and shall thus force themselves into general favor at once. The shore gunners have such names for many of our bay birds and ducks, and the humble bayman has in many cases been most happy in his namings, as there has always been some reas for homely appellations. He seizes some salient and characteristic point about an animal, and names it from that peculiarity. If we are to instruct and raise a higher standard of sport-and this, as sporting writers, is an aim that we shall not lose sight of-we must dot down our experiences in a way that can be readily understood by all, and preach our sermons with "simplicity" for our Therefore, we shall begin by giving a list of the birds worth shooting commonly called "Bay Snipe," and as far as possible, the names of each species used in the districts where they are shot. By this, the sportsmen of our coast, from New Hampshire to North Carolina, will be able to distinguish the same hird under its guise of many local aliases, and the list will act as a key for the subject on which we are about to write. The following is such a list of birds shot over decoys or stools, including the waders and plovers commonly called

BAY SNIPE.
Long-billed curlew (Numenius longirostris), sickle'bill; sabre-bill Sickle-bill is the name almost universally used. It is simple and descriptive.

Hudsonian curlew (Nunchius hudsonicus), Jack: short-billed writew. The Long Island baymen term this bird the Jack, while o both the eastward and southward he is more often called the

short-billed-curlew.
Esquimaux curlew (Numenius borealis), fute; doe bird; little curiew. In the Eastern States it is called the doe bird; not Long Island the fute, and in parts of the South the little curiew. The origin of the first two names we have falled to ascertain; the third

Black-bellied plover (Squatarola helvetica), black-breast; bullhead; beetle-head; ox-eye; bottle-head; pilot. On Long Island nead; better-lead; ox-eye; notter-head; pind. On Long Island this bird is generally known as the black-breast, on account of the black markings of its plumage. The young in August are, however, gray on the belly and are often mistaken for a distinct species. In New Jersey and Pennsylvania it is called both bullhead and beetle-head, and also, in the latter, ox-eye. On the coas of Virginia, about Cobb's Island, the name of pilot has been given on virginia, addition to a state in the father problems were level in sit is always seen leading the large flights of birds which the rising tides drive from the shoals and oyster nocks, and it is sup-posed to direct the flocks "to pastures new." This, however, is not the case. It is the fastest thing bird of all the bay snipe, and it cannot fiv slow enough for the other species.

tteanothy slow enough for the other species.
Golden ployer (Charactius futus var. tripinieus), golden back:
green back; frost bird; whistling plover; bull-head. On Long
Island and to the eastward it used to be known as the frost bird
so called on account of its appearance at the time of the early frosts in autumn, but of late years it has generally been called the golden back. On the New Jersey and Delaware coasts it is termed the green-back.

termed the green-back.

Great marbled godwit (Limosa fedoa), marlin; humility; brown back; straight-billed curlew. Known along the seaboard, from Maine to Maryland, as the marlin, though occasionally called the humility or humilt, which name has also been given to the upland ployer. On the coast of Maryland and Virginia it is known as the brown-back. In New Jersey it is sometimes called the straight-

Hudsonian godwit (Limesa hudsonica), ring-tailed marlin white-tailed marile; humber accounts, was cause mann, white-tailed marile; humber as the ring-tailed marile, so called from the white band crossing the tail feathers. In parts of New Jursey known as the Virginia woodcook. Semi-paimated snipe (Thirmus semiprimatus), willet; marbled

Usually known as the willet, on account of its cry.

Tell-tale tattler, or suipe (Tolanus mehtnoleuca); yelper: big yellow-legs; great yellow-shanks; tell-tale tattler; stone-snipe large cucu; willet. Familiar to all sportsmen as the biz vellow wires, great fellow-shades, terriane tacter, somewhere, cucu; willet. Familiar to all sportsmen as the big yellow in parts of New Jersey called the willet; on Long Island to upper coast of New Jersey, the yelper, on account of its piercing notes.

Yellow-shanks tattler or snipė (Tolanus flavipes); yellow legs little vellow legs: lesser tell-tale. Known everywhere as the

Pollow-legs.
Red-breasted-snipe Macrorhamphus griscus; dowltch; dowttcher; quali-snipe; brown-back; grey snipe; driver. On Long
Jsland and the northern coss of New Jersey called the dowltch:

South New Jersey, Delaware, Maryland Virginia and North Caro-

South New Jersey, Denaware, amy man, Thomas Tent is in the chick-ling, the brown-back.

Turnstone (Strepellas interpres); calico-back; brant bird; chick-ling; chicaric; sand runner; borse-foot snipe; beach bird. In Virginia, Maryland, Delaware, Southern New Jersey, the calico-back, on account of its reddish brown mottled colored, bock; Northern New Jersey, the lorse-foot; Long Island and to the eastward, the brent bird; the young on the New Jersey coast are called brach birds. alled beach birds. Red-breasted sandpiper (Trings canutus) robin spine: knot:

near-oreated sanapper (Iringa canatus) robin sinje; k.fot; ash-colored sanapper; grey-back; white robin sinje. Generally known everywhore on Long feland and New Jersey as the robin sinje, se called in the spring, as its brown plumage resembles the red-breasted thrush, or robin. In Soptember in the South, it is called both grey back and white robin sinje.

Pectoral sandpiper (Tringa maculata); krieker; mendow spine records saddipper (trings maculata); kreker; meanow sinju; fat bird; short-neck; jack snipe; marsh plover; grass snipe; robin snipe; red-back. On account of its creaking, shrill cry, it is called the kricker on the Northern New Jersey coast, but further south it changes its name to short-neck and fat bird. On the inland meadows of New Jersey it is known as the robin snipe and meadow snipe. On Long Island it assumes several of the names. It is said to never stool, but we have seen it do so On Long Island it assumes several of the above onally. Red-backed sandpiper (Tringa alpina var. Americana): black-

breast; black-breasted ployer; winter snipe; red-back. Known on the coast from Maine to Florida, its most common name being the black-breast.

sandpiper (Micropaluma himanlopus): stilt: basthe mack-breast.

Long-legged sandpiper (Micropalama himanlopus); stilt; bastard dowitch; bastard yellow leg; wood snipe; blind snipe; frost snipe; peep; drum-stick. On Long Island it is called the bastard dowitch, and on the Jersey coast, the blind snipe.

The above list comprises the different varieties of bay snipe that are worthy of the sportsman's aim. In addition to these there are the small plovers, called ringnecks, beach-snipe and surf-snipe, and the tiny sand pipers, such as the ox-eyes, sand-snipe, shore birds and peeps, excellent when roasted, but only fit for little beginners to pop away at.

THE BUCKS COUNTY ASSOCIATION .- A game associa tion has been organized in Bristol, Pa., under the name of the "Bucks County Game Protective Association." Its object is the rigid enforcement of the game law in the townships bordering on the Delaware River, comprising the section between Philadelphia and Trenton. John Burton, of Tullytown, is President; George A. Shocmaker, of Bristol, Secretary; Cornwell Woolston, of Emilie, Treasurer; Arthur Dorrance, Charles E. Scott, W. D. Harned, Bobert W. Rogers, G. W. Kirk, M. D., Amos B. Headly, Edward S. Stackhouse, and Joseph S. Hibbs, constitute a Board of Directors. The admission fee is fifty cents, each member pledging himself to pay such necessary assessments for police, etc., as may be levied from time to time by the directors. Although the club was organized so lately as June 29th, the membership fees alone are ample to run it for the present season. Game constables were placed on woodcock ground on July 1st, and did good service up to the 5th inst. The reed and rail marshes and quail and rabbit grounds will be duly watched until the opening day. Much good has heretofore been done in the vicinity of Bristol by individual effort, and this organized action cannot fail of suc cess. Gunners and farmers freely tender their coopera-The officers and directors of the new association are thorough business men, some of them very wealthy, and all energetic. We hope that they may capture and punish some of the pot-hunters and selfstyled sportsmen from the adjacent cities.

CREDIT WHERE CREDIT IS DUE .- In our issue of May 6th we published a description of Grand Falls, N. B., concerning which that accomplished author, Mr. Chas.

Lanman, writes to us as follows:—
One of your correspondents prints some information about Grand Falls of New Brunswick. I presume he means those of the Grand rais of New Drubswick. I presume ne inclusiones of the river St. John, as he does not seem to know augiting about the Fulls of the Nepissiguit. I that is so, let make inform him that ho has not exactly made a discovery. The Falls of the St. John were described in one of my books as far back as 1948; and in RST 1 published large woodcuts of them in the London Rubsritet News. which Harrer's Weeldy copied, locating the scene in Maine and passing it off as original.

R. T. Greene for a copy of Washington's letter on bloodhounds. The original letter came into my possession many years ago, and Iprinted a copy in the London Atheneum, and also in the New York Elenking Post, so that I can testify to the accuracy of the copy printed by you.

It was once and the

It was once, and it may be now, the rule of the London Times to consider all news unpublished which had not appeared in its own columns, and sometimes acting on this principle with great arrogance, but with imperturbable gravity, it would publish matter that had appeared in all the other papers a fortnight before. In its own special field, the Forest and Stream acts on the same rule, holding that no angling resort, no hunting ground, no curiosity of sporting literature has been published until contained in its own columns, and this rule it acts upon, even in describing resorts which have already had a place in such widely circulated books as those of our accomplished correspondent. This new delving in the "old fieldes" detracts nothing from the credit of those who have worked there before us. Indeed, we have on who have worked there before us. Indeed, we have on our desk now something that has three times been pub-lished to the world; first, three hundred years ago in Latin, then in English black letter, and again on a steam press in modern type, and this we propose to put into print for a fourth time.

We should add that the correspondent who sent us the Washington letter copied it from what he believed to be the original manuscript, bought in Washington by Mr. John Dale, and now in that gentleman's possession.

Mr. Lamoan's very readable sketch, published in this issue, forms one of the chapters of a forthcoming book by that author.

AMERICAN ARMS ABROAD,-The recent continued depression in the Birmingham gun trade has caused great anxiety among English manufacturers, and they have memorialized the government for assistance. The result of their petition has been that the government has decided to issue large orders for guns and rifles within a short time, and thus to give substantial aid to the gunmaking industry.

The Boston Daily Advertiser makes use of this state of things as a text for a very sensible discourse on the importance of the arm-making industry in this country, from which we extract the following :-

The principal reason for this depression in the English gun The principal reason for this depression in the Lagrian gun trade is that American manufacturers have been able to obtain the foreign customers that were formerly supplied by the Eng-Hsh. The Turkish government, although desirous of retaining the friendship of England, saw that the superior arms and am-munifien made in this country were essential in order to make the most effective resistance, and therefore gave to New England the most effective resistance, and therefore gave to saw beginned the trade that formerly would have been given to old England. To the Providence Tool Company contracts for 655,000 Peathody-Martini ritles were given—a contract which brought to the com-pany between nine and ten millions of dollars. The Winchester pany between nine and ten millions of dollars. The Winchester Arms Company, of Now Haven, obtained large contracts for arms and cartridges, and millions of cartridges were also pur-chesed from the Union Metallic Cartridge Company of Bridge-port. The total amount expended in this country by the Turkish government for munitions of war for use in its recent struggle with Russia is estimated at over \$50,000,000.

with flussla is estimated at over \$80,000,000. In case of great emergency the private workshops of this country could daily fabricate thousands of ribes and millions of carteriages; these articles could be supplied much faster than troops could be found to use them.

The valuation of the national armory and arsenals and the government of these property of these places much in the case.

The valuation of the fucional armory and accentain that the government property at those places amounted, in 1871, to Su)(60,000. At the Rock island arcenal there has been spent, up to December, 1876, \$5,509,534.3 and a further expenditure of \$28,0000, it is estimated, will be required to complete this arsenal, exclusive of the necessary machinery and shop laxtures. Would it not be the necessary machinery and shop factores. Would then be better to sell these government nanufacturing establishments and apply the proceeds to the purchase of the needed armament for sea-coast defense?

A SUGGESTION FOR KENNEL CLUBS .- In the British Islands are thousands of dog fanciers who breed dogs with the hope of producing animals of such superior merit as eventually, in one way or another, to bring in not only a return for the expense of their rearing, but a handsome profit beside. An English contemporary notes that only a very few of these breeders ever succeed. To establish a strain which shall show a distinct family type of excellence requires a large kennel and long continued of excellence requires a large kernel and long continued care and expense. One-dog breeders cannot succeed in originating strains. It is suggested that instead of so much misplaced and fruitless, because inadequate, effort in this direction, some of the larger kennel clubs provide themselves with the requisite number of animals, and then, under the supervision of a select and competent committee, carry out the experiments which shall develop by long and judicious management the strains possessing the approved qualities. In this way, also, many of the mooted points as to inter-breeding, etc., may be satisfactorily set at rest.

SALMON IN CALEDONIA CREEK, - On account of the Governor's veto to the annual appropriation bill for the New York Fish Commission, there was not money enough to do all the work, and to cut down expenses the ponds of quinnat, Atlantic and land-locked salmon, which had been raised at the State hatchery at Mumford, were turned loose in Caledonia Creek, where the fishermen are catching them. These fish were from one to three pounds in weight, and very valuable for breeders, and it is much to be regretted that such a course was rendered necessary.

Surely the good work done by the New York Fish Commission is worthy of being continued, and it is to be hoped that the Governor will reconsider his veto at the earliest opportunity.

The Utica Game and Fish Protective Association having formed itself into a strong body of energetic workers, is now endeavoring to secure the organization of local clubs in the adjacent towns of Camden, Rome, Paris, Sangerfield, Boonville and Trenton; and also to secure in other smaller towns a representation by membership.

We are pleased to learn that the new association is increasing in numbers and in strength.

-The officers of the Blooming Grove Park Association for the year ending July 5th, 1881, are: President and Director, John McGinnis, Jr.; Vice-President, W. F. Wharton, Directors: F. Fearing, C. A. Grines, L. Snyder, C. H. Read, T. C. Clarke, R. L. Ward, M. B. Brown, D. B. Mouzilly; Secretary, T. W. B. Hughes. The trustees for the new issue of bonds are: P. M. Wilson, Hamilton Busby, John Avery,

THE THOUSAND ISLANDS AND DOWN THE ST.

BY CHARLES LANMAN.

TO an old traveler, the idea of revisiting Lake Ontario, the Thousand Islands and the valley of the St. Lawrence is replete with pleasant anticipations: and aside from their own peculiar attractions, Niagara and Montreal cannot but be affectionately remembered, because of the world of beauty which lies between them. Of the five great inland seas (which should belong exclusively to the United States), Ontario, although the smallest, is not one whit behind its fellows in its achievements and possessions. Superior may well be proud of its matchless proportions, of its copper mines, pictured rocks, Royal Island, Thunder Cape, beautiful tributaries and the Sault Ste Marie; Michigan may boast of its Green Bay and great city of Chicago, and claim that no other waters on the globe are hennined in by a more magnificent domain; Huron, with its Georgian and Saginaw bays, the Island of Mackinaw, the daughter lake of the St. Clair, and the river and city of Detroit, well deserves to occupy its central and commanding position; and Eric can well afford to let expressive silence muse its praise while pointing to the Falls of the Niagara; but of Ontario it may be said that within its bosom alone are mingled the waters of all tac great lakes, and that out of the depths comes forth the most fruity magnificent river on the Continue, not even

where they have not been despoiled and desecrated by the hand of man are universally beautiful. As the steamer pursues her intricate course between them the traveler wonders how she can ever escape the impending dangers, and when he passes into what seems a beautiful lake, he experiences a sense of relief. To describe these islands minutely must always be as difficult or impossible as to depict those of Lake George or the Thimble Islands of Long Island Sound, but while their charms are linked with the sea or a mountain land, those of the St. Lawrence seem to be the very children of the sky. In the level and far-reaching horizon which completely surrounds them, there is something marvelously impressive, and I have fancied that after nature had finished her work in this particular region, she deemed it well to draw aside and put out of sight all the high mountains, and remove far hence the roar of the waves on the shore of the cocam. Here, during the summer nights, no sounds fall upon the car save the soft music of the flowing waters, and the weird voices of the owl and the loon. With the approach of dawn, birds without number, the kingfisher and bluebird, the blackbird and robin and flicker, the coot and the duck, come forth from their hiding places to resume the duties of their happy lives, and at the sunset hour the islands, as you look upon them, appear like genus encircled in halos of crimson or gold. But alas! their virgin splendor is rapidly passing away; the simple hearted Indians, with their campites and canoes, have been superseded by the selfish and savage white men with their villas and yachts and other modern abominations.

manding politics is and brice our well afford to be the problem of savage while hier with their vinas and yacitis and other modern abominations. It was among the multitudinous islands of this river that the poet Thomas Moore conceived the idea of his charming Canadian Boat Song, although the actual scene

After leaving the Thousand Islands, on the route down the St. Lawrence, the leading attractions are the Rapids, Within the space of about one hundred niles below Prescott and Ogdensburg, which are on opposite sides of the river, the fall of water is about one hundred attractions are the strength of the river. The fall of water is about one hundred attraction to the strength of th

modern rival in the city of New York, now the linest church editice in the United States.

Of course I could not leave Montreal without calling to pay my respects to the most noted and most venerable angler on the continent—Harrison Stephens. I found him in his elegant mension, but living with his noble wife in the same unpretending manner that has always been his choice. His enthusiasm for angling seemed to be as great as ever, and he recalled, with enthusiastic comments, our joint experiences in throwing the fly for bass under the Victoria Bridge, and for salmon in other parts of Canada. He also fold me that having heard of a certain lake in the valley of the St. Marnee, which was famous for its trout, he had purchased not less than 14,000 acres of land which surrounded it, and that I must not fail to join him in a trouting expedition to that lake next summer. Mr. Stephens is now in the seventy-eighth year of his age, and, although a native of Vermont, he has been identified with Canada for fifty years, and is reputed to be the wealthless man in the Dominion.

and is replace to be the weathnest man in the Dominion.

I was glad to learn that among the reading people of Montreal, the late Charles Heavysege was still held in affectionate remembrance. Although "nothing but a poet," he was, at the time of his death, in 1876, the most effect was a still held in affectionate remembrance. Although "nothing but a poet," he was, at the time of his death, in 1876, the most effect was a still held in a poet, and there are thousands who never heard his name, but they are the people who would wonder at the mention of the names of Milton and Bunyan and Goldsmith. As I have elsewhere recorded my opinion of this brilliant poet of the North, I will resist the temptation to say more at the present time.

When about to continue our journey to Quebec, I was agreeably surprised to learn that the north shore of that part of the St. Lawrence could be seen and enjoyed from a railway train, and I was glad to avoid going down the river in a steamer at mght, or faking the winding route by railway through fischmond. This part of the Dominion is thickly settled, and although the scencry is not especially attractive, there was something

particularly charming to me in the population, the farms and in the numerous villages. The people are exclusively French habitans, and the little churches with twin steeples, the wooden houses one story and a half high, with dormer windows and comfortable porches, and the long lines of rail fences, all reminded me of the Detroit and Raisin rivers—so pleasantly associated with my childhood. Indeed, the rural scenery of the St. Lawrence from Montreal, on both sides of the river as far as Murray Bay on the north and Metis on the south, is peculiar and full of interest. To use the language of a friend, the principal roads of each parish run parallel with the river, and are completely lined with these rural dwellings. As a class the inhabitants are devoted to agriculture; entirely destitute of enterprise, they tread in the steps of their fathers. There is, perhaps, no more cheerful, loppy or contented being in existence than the habitor: his little farm supplies him with enough to live upon, and he never gives himself anxiety about to morrow. The men, like the old French peasantry, wear the picturesque cappd, and on their feet morasnism made of cowhide; the women jackets of bright colors, and on their heads either a cap or straw hat, made in the gipsy fashion. They are fond of social intercourse, and spend a goodly portion of their time in visiting each other. Those who live in the vicinity of Quebec or Montreal partly supply those markets with vegetables, and it is not an unusual thing for the tourist in the remotest nooks to come suddenly upon one of this race, trudging along staff in hand, and a bundle of baskets on his back, which he will shortly fill with herries, to be taken perhaps many a mile to market, and happy in his simplicity, humming to himself the burden of some old Norman song brought new 10 his forefathers centuries ago. In the habitan's house the walls are always well while about the bright with the sunshine of the human heart, which beams out on these rugged spots of Nature's handwork.

Among the

and as many coastiful surroundings can held be changed, but the city is not now what it was in days of yore.

Politically speaking, it is compelled to be subordmate to Ottawa, the new seat of government, which is without a history, and indebted for its prosperity to American enterprise. This fact alone is a bitter pill to the people of Quebec; and the changes which have taken place in the city itself are universally regretted by those who have recently revisited it during their sunnier tours. The old French market, with its delightful characteristics, is a thing only of the past; the picturesque gateways in all directions, and hundreds of the historical and fantastic houses, have been demolished; and the old calcele, with its obliging and polite habiton driver, have been superseded by an uncoult Yankee invention, and the most exasperating breed of English and Irish hackment to be found on the face of the earth.

The same nucient French is spoken to-day as in the olden time; social intimucy between the French and English people is quite as invisible as it was a century ago, and the general desolation of the Roman Catholic institutions is about the same as ever. To please one of my companions, I stepped into the Convent of Gray Nuns for a few moments, only to see the wretched beings cooped up in desolate rooms within their prison bars, and to find the Pather Confessor, in his far more confortable room, descanting on the skull of Monteulm, as if to exhibit the relie was a privilege of incalculable inportance.

if to exhibit the relic was a privilege of meacuraone mortance.

Among the many sensible suggestions made by the late Governor General (Lord Dufferin) was one that the walls and gateways of Quebec should be restored to their former condition, and the work was commenced, but has now been suspended for want of sufficient means. But this suggestion about the walls of Quebec was eclipsed by that other proposition, from the same gifted man, that the entire country round the falls of Niagara should be transformed into an immense international park, and neutral ground for the people of all climes.

But I rejoice to know that there has been no retro-

neutral ground for the people of all climes.

But I rejoice to know that there has been no retrograde movement in Quebec, so far as its intellectual character is exemplified by J. M. Le Moine, He is undoubtedly the most interesting literary man in Canada, and his "Maple Leaves," "History of Quebec," "Chronicles of the St. Lawrence," and very numerous descriptions of the scenery and people of his native Province are distinguished for their merit and usefulness. And it may be said of this well-known author that, on the score of family pride, there is not another native of Canada who has a better right to be satisfied. During the last two hundred years not less than seven of his ancestors have found a place in history by doing much to advance French explorations, conquests and settlements in Canada and the United States.

During a stroll that we took through the grounds of

During a stroll that we took through the grounds of the Citadel we net "Lorne and Louise." (Want of time and space prevents me from here giving all the preposterous titles which the poor Canadians are perpetually repeating.) The gentleman appeared to have a fine and manly countergame, but the latest to have a fine and and space prevents me from here giving all the preposterous titles which the poor Canadians are perpetually
repeating.) The gentleman appared to have a fine and
manly countenance, but the lady was so busy with her
two dogs that we could not distinguish her features, although the portrait in Robert Buchanan's book represents
her as quite handsome. It is presumed that these noted
personages have many noble qualities of mind and heart,
but there is something sickening to a Yankee to hear the
fulsome adulation that is constantly showered upon
them by the English Canadians. The wretched minion
of a soldier who took us about the Citadel pointed out
he plain building where the Queen's daughter does her
eating and sleeping after the manner of ordinary human
beings; and he told us that she was a "great artist," and
was always painting; that she was fond of a morning
yalk, like common people, and that on a recent occasion,

when the rain beat through a window and wet the floor of her chamber, she refused to let her servant wipe up the water, but went down upon her own knees and performed the necessary task. When the Queen's daughter can condescend to such service, should we not tremble for the continued supremacy of England?

At this present writing, it is just thirty-two years since "mine host" of the good old St. Louis Hotel extended to me his right hand of hospitality, although then located in a different locality: and because of all he has hitherto done in helping me to reach my fishing rivers in comfort I cannot but cherish his name with affection. As I sat chatting with him about the olden times, he told me done in helping me to reach my fishing rivers in comfort I cannot but cherish his name with affection. As I sat chatting with him about the olden times, he told me that his son was now the chief manager of the hotel, and also that this very agreeable gentleman was not born at the time I made my first visit to the river Saguenay, when my three-masted hobitan smack, engaged for the expedition, was promised from the bountiful larder of Russell's Hotel. It was also with special satisfaction that my good friend informed me that a very large proportion of the summer travelers to Quebe recularly extend their tours to the Saguenay, and that I was the man who should be blamed for this annual exodus down the St, Lawrence. This was to me a most gratifying compliment, and an appropriate sequel to another which was paid to me in this very city by the Earl of Elgin, who, while I was enjoying a dinner at Spencer Wood, in 1850, exhibited to me a book just received, which was the English edition of my "Tour to the River Saguenay."

DEER AND DEER'S HORNS.

N a former number of your valuable publication, and in answer to the question whatler do not be a local to the control of the publication whatler do not be a local to the control of the In a former number of your valuable publication, and in answer to the question whether deer, when fighting, are apt to get entangled with their horns, you replied in the affirmative. In reference to this subject, I take the liberty of sending to you a couple of photographs taken from horns in my possession and forming part of a choice collection of more than three hundred pairs of horns collected by me during a residence of over thirty years in Texas. During this period I have hunted deer in preference to any other game, and in this manner have acquired some knowledge of the subject in question. In the rutting season fights among the bucks are of frequent occurrence, perticularly where there are few invariably desperate, and bucks shot in this season often bear the marks of these conflicts, either in the shape of open wounds or spots under the skin, evidently the result of blows received from their antagonists.

The horns are often injured and either single antlers broken off or even the entire beams. The bucks attack each other very much as do billy-goats, though with greater fury, and the clash of their horns is often heard to some distance. During this season the hunter frequently succeeds in killing a sly old buck which had outgeneralled him for years. Some of the handsomest trophies in my collection are horns of bucks shot during the rutting season. Before that time, that is to say, before the month of November in Western Texas, the old

bucks are very rarely seen. They browse by night only, and with daybreak disappear in the thicket, not to leave it again until nightfall. The hunter, therefore, but seldom gets a shot at one of them.

But occasionally, when spurred by lust and jealousy, the old buck is tempted to leave the shelter of the woods, to which he is never to return.

Further West, toward the Rio Grande, the rutting season commonees later, and not until the middle of December. During an extensive tour which I made in December last to the hunting grounds between the Nucees River and Rio Grande, in company with several friends, we saw but few bucks, owing to the fact that the rutting season had not commenced as yet, the bucks meanwhile remaining concealed in the impenetrable thickets of mesquit brush and prickly pear so characteristic of that region. In January I again went over the same ground in the company of a single fellow sportsman, and we had the good luck to kill seventy-one deer inside of two weeks, of which fifty-three were bucks and only eighteen does. Everwhere the sandy soil showed traces of the desperate conflicts between the bucks, large patches of ground being turned up by the hoofs of the combatants, and in one place I could distinctly perceive that the horns of two bucks had become entangled, and the stronger of the two had dragged the other some distance. Undoubtedly they were separated by some locky accident, as I could discover no further tracks of them.

The deer, in the country between the Nueces and the

them. The deer, in the country between the Nueces and the Rio Grande, feed almost exclusively upon the everabundant prickly pear, as do the numerous flocks of sheep grazing in that section. They require only little water, in quest of which they go but seldom. Their color is far darker than that of the deer found further East, which live on grass, acorns, etc.; these latter are generally larger in size, but the former have comparatively larger horns. The fact of their feeding exclusively on prickly pear may account in some degree for their

beautiful, lustrous skins, with a very dark stripe on the back. It is also remarkable that their liver is not of the ordinary dark color, but on the contrary of a light buff.

Both specimens of which I send photographs are curiosities in their way, for, as a general rule, when two deer engage in a fight they rush at each other face to face, and their heads remain in this position in case their horns become entangled. This is nearly always the case, but here is an instance where two bucks were found side by side, like a team of horses, firmly held together by their horns and still alive. The other couple were found with the back of their heads together. One of the deer was already dead when found and the other was specially by side, like a team of horses, firmly held together by their horns and still alive. The other couple were found with the back of their beads together. One of the deer was already dead when found and the other was speedily dispatched by a bullet, which saved him from a more miserable death by hunger.

A third photograph which I likewise inclose for your use might be of interest to sportsmen and perhaps

A third photograph which I likewise inclose for your use night be of interest to sportsmen and perhaps deserving to appear in your columns in the shape of a wood cut. The deer was shot in the neighborhood of Austin and the horns are in my collection, which can boast of many other curious specimens. The left beam has twenty-eight and the right beam twenty-four, in all fifter two applies. Such a deer is certainly something uns twenty-eight and the right beam eventy-out, and by-two antlers. Such a deer is certainly something uncedented, and, in Texas at least, not to be found E. Dosch. fifty-two antlers. again.
San Antonio, Texas, May 10th.

A FINE DEER'S HEAD.—Our correspondent, R. S. J., of Menominec, Wis., tells us of a remarkable pair of deer antiers now in his possession. He says:—
"I have in my possession a fine buck's head with large antiers; the left has five points, the right is nearly the same, only a large prong separates near the head on which are six points, some pointing and reaching nearly as far as the nose, while others run out nearly as far as the main horn."

#### .... THE STING RAY.

Corpus Christi, Texas, June 14th.

THE STING RAY.

\*\*Cords Christi, Texas, June 14th.

\*\*Elitor Forest and Stream:—

Inclosed I hand you a product of our waters, which, although common enough here may be something of a curiosity with you. It is the sting or thorn taken from the tail of a sting ray, commonly called and spelled "sting-ev-ee." This fish is very plentiful in these waters in the spring, summer and fall of the year, disappearing in the winter.

The first cold weather which lasts long enough to put much of a chill on the water sends them to their hiding place, and we see them no more until the warm days of spring have made the water more congenial to them. They either bury in the sand, or hunt deep water during the cold weather.

Excluding the long whip-like tail, the sting ray measures about one-sixth more in width than in length. The one from which the inclosed sting was taken measured about two feet is inches across the back. The tail was nearly if not quite three feet in length.

The sting was about ix inches from the body, and lay flat on the tail. It is not, as many fancy, capable of being raised in an upright position for agreessive or defensive purposes, but can only do harm by the fish working its tail from side to side, in which case any object in the way is liable to get pierced. This sting in its original condition is covered with a slime which is very poisonous, and a yone wounded by one of them is in great danger from lockjaw. There are several instances known here of death resulting from the wound, and there are many cases where the sufferer has been confined to his bed for months. This fish gives birth to from two to eight at a time, It is covered with a slow and the working smooth skin, lony, well smith the headath. The two eyes are on top, well smith in the lendand well protected from injury outside of which is a coating of tough sime. It is dark brown above, and white heneath. The two eyes are on top, well sunk in the head and well protected from injury. The mouth is underneath and about three or four inches back from the end of the nose. The gills are slits in the skin similar to those of the shark, and are situated on each side of the mouth, only further back. The cavity for the entrails extends the full length and is almost as

each side of the mouth, only further back. The cavity for the entrails extends the full length and is almost as well protected as that of a soft turtle. In fact, this fish looks more like a soft shell turtle, without feet and with a riding whip attached for a tail, than it does like a fish. It is a bold and free biter, and is nowerful, giving to the angler fine sport. It is very cunning when looked, for as soon as it is fired and finds itself liable to be vanquished it lays itself. flat on the bottom, and the stranger fancies his fish is gone and he has captured a snag instead. Nothing will move the string ray after he locates himself except a long pole or a very strong line. The mouth is very tough, and a hook has always to be cut out. The flesh is very fine eating, and it is said before the introduction of steam the ray was the only sea fish that was eaten fresh in Paris, as it will live long and keep well out of water, if placed in wet moss. There is a prejudice with many against eating rays on account of their hideous appearance.

They grow to great size, half a ton or more; when of this size, the name changes and they are called devil fish. I have seen these large fellows on a still morning jump out of the water twenty feet and come down flat, making a noise like a young cannon. These large ones are never cantured in this vicinity, as they can break any

ing a noise like a young cannon. These large ones are never captured in this vicinity, as they can break any

never captured in this vicinity, as they can break any tackle they choose to tackle.

The largest one I ever captured was about 100 pounds weight, and was between four and five feet across the back. The thorn on the tail measured just nine inches in length. It is not uncommon for them to have two and sometimes three thorns on the tail. They feed on small fish, crabs and sommin.

BEXAR.

WINTER STORE OF THE GRAY SQUIRREL.—Long Prairie, Minn., June 4th.—Editor Forest and Stream:—In a recent issue of Forest and Stream:—In a recent issue of Forest AND STREAM "Sharp Eyes" states his belief that the gray squirrel does not lay up a store of food for winter. I am inclined to believe the gray squirrel is not such a fool as this would seem to make him, and will give my reasons for such belief. My father moved into the State of Indiana forty years ago and settled in the timber, and was brought up among gry squirrels, and the same might almost be said of the writer. Many a time have I watched the gray squirrel ascend a hickory tree, and taking a unt in his mouth carry it to some hiding place and return again for an-

other; but I never followed one up to see where the hiding place for his store was situated, whether in the ground or in some hollow tree. My father has seen them keep this up for hours, and so have I. In winter I have seen places where they have dug into the ground in perhaps a dozen places around one tree, and the fact that these trees were not all fruit-bearing trees leads to the belief that the squirrel had buried something there and know, just where to dig for it. Indeed, the most of the trees around which I have seen these holes were hollow elms, or soft maples, and nany times far removed from any nut-bearing trees of any kind. My father and I felled a lange ash one winter in which two grays squires. hollow elms, or soft maples, and many times far removed from any nut-bearing trees of any kind. My father and I felled a hugo ash one winter in which two gray squirrels had made their homes, and I found perhaps four or tive dozen of good hickory nuts in the hollow, and it looks very nuch as if they were placed there by these squirrels. With all these observations before me, you can count me in as one who believes the gray squirrel lays up his store of food for winter.

A. W. S.

lays up his store of food for winter.

FOOD OF THE GREAT BLUE HERON.—This season I killed a large blue heron which had two moccasin snakes in him, one of which was quite large, over two feet long, and fully an inch through; the other, a third smaller. I am of the opinion that all of our large herons eat young snakes, and that this is one reason of the remarkable secretity of snakes in Florida; another is, that the alligators devour every snake they can catch.

I have known the blue heron to swallow a grown mullet. This last scason I killed a heron, and, while carrying him, I noticed that he was unusually heavy, and, when I had got home and skinned him, I noticed that he was full from throat to stern and proceeded to examine him. I found a fish, which was some four inches longer than the body of the bird, and fully half as heavy. How this bird captured the fish and raised him to swallow, I cannot conceive. But, since the foregoing experience, I came suddenly on to a heron on the beach that was busily engaged with a catfish some nine inches long. I could have believed that he might have swallowed the cut, but for the great and formidable fins. He left the fish without ceremony, but I pulled on him and took his skin. Since that thue I found a fin in the throat of one, so I am satisfied that they eat both mullet and catfish. The pelican will also take in a full-grown mullet with case. The cormorant will eat more fish than a person, and it is astonishing what large fish they swallow.

A WHITE KING BIRD .-- The following cutting is taken from the Norwich (Conn.) Bulletin of July 19th :-

from the Norwich (Conn.) Bulletin of July 19th:

An interesting busis nature was discovered on Laurel Hillast week. A king bird, or "tyrant fly-catcher," which, instead of being brown, like its kind, was pure white, except its wings and tail, which were of a creemy hue, stunned itself by some accident and fell in front or Judge Park's residence. It was picked up and placed in a cage, but after three or four days it died, owing, doubtless, to the fact that these birds are insectivorous, and its captors, not knowing its predilections, furnished it with other food. An ormithologist and taxidermist having been requested to stuff the bird for preservation on Saturday, readily identified its species by its head and other characteristics. It is a handsome but singular specimen.

A Novel Rat Catcher.—Cool Spring, N. C., July 27th.—At my kennels to-day I killed a water snake, in which I found a full-grown barn rat. The snake measured twenty-two inches in length; head, quarter of an inch across, and three-quarters of an inch long. The rat was in perfect condition, fat, healthy and strong looking. It had just been swallowed, I judge, as it was in perfect condition, fat, healthy and strong looking. was in perfect shape, coat, preservation, etc. No wounds were discovered on either reptile or rodent. A rat is 'game' to the death. Query: How could so small a snake catch and swallow so large a rat, and not show signs of a conflict? Again, with so small a 'jaw' (and necessarily weak, to hold the rodent) could the snake have killed it in any other way than by coiling around it, thereby rendering the rat powerless? What say our naturalists.' E. S. WANNAMAKER, ing. It name perfect shape

May not the snake have drowned his prev?

DEEP SEA DREDGING. - The United States survey steamer, Blake, came into Newport last Saturday, after a two months' trip on the Atlantic coast, where she has been engaged in deep sea researches, under direction of Prof. A. Agassiz. The explorations were made between Cape Hatteras and George's Banks. Five lines of soundings were run at right angles to the coast between these points, and a great quantity of zoological material obtained. With the exception of the groups to be worked up at Cambridge by Prof. Agassiz himself, assisted by Col, Lyman, the collection is to be turned over to the same zoologists who have worked up the specimens obtained in former years by the United States Fish Commission on the eastern coast of North America, the crustaceans going to Prof. S. J. Smith; the invertebrates to Prof. E. A. Verrill, and the fishes to Prof. G. Brown Goode and Dr. J. H. Bean.

A CANNIBALISTIC SNAKE.-Mr. C. R. Shaw recently killed, at Sayville, L. I., a black snake which was thirty nine inches long and about as large as a man's thumb. It appeared somewhat thicker than it should have been, and was more sluggish in its movements than black snakes ordinarily are. On shaking the reptile by the tail, a striped snake, which measured nineteen inches in length came from its mouth. The smaller snake had been swallowed head first, and was still alive. Neither snake was in a condition to hiss. We do not remember even to have observed a case quite similar to the one above mentioned, though it is not an uncommon thing to find snakes with partially devoured and still living fregs protruding from their mouths.

Animals Received at Central Park Menagerie for the week ending July 24th, 1880.—Two Arabian sheep ((mis artic), presented by Capit, Gorringe, S. S. Dessonge; one red fox (Vulpes fulus), presented by Mr. Lawson Valentine, Mountainville, N. v.; one slug (Linar facus), presented by Samuel W. Francis, Newport, R. I.; one magpie, (Picar instein), presented by Mr. Morris Loonie; por golden paped Amager. (Chrushie anxishint) presented by mr. Morris Loonie; por golden paped Amager. one golden-naped Amazon (Chrysolis curipillata), presented Mrs. D. Lenilan; two Angora goats (Capra hirens), received in exchange; one mona monkey (\*\*Peropilheus mona); four maudits (\*\*)meriphatus morno); one red brocket (\*\*Cariacus 10/18) one Sallé's Amazon (\*\*Chrysotis sallech—all purchased. A BIG CALIFORNIA SALMON FROM GENEVA LAKE. - BY favor of Prof. Baird we are permitted to publish the following telegram :-

GENEVA LAKE, Wis., July 29th.

PROF. SPENCER F. BAHD: —A California salmon weighing twelve pounds and three-fourths was taken with a hook from Geneva Lake this morning.

N. K. FARRANK.

This is an exceedingly large salmon to have been grown in fresh water, for it is not at all probable that the fish ever left the deep, cool waters of this lake to follow the small streams which finally lead into the Illinois River, and so down the Mississippi to the ocean-a glance at the map of Wisconsin and Illinois will show this to be almost impossible. You will find Geneva Lake in Walworth County, Wis., and even if it had been possible for the fish to go down and return it would only add greater interest to its history. This lake is a favorite summer resort. and has been stocked with many kinds of fishes by Mr. Fairbank at his own expense.

We hope for more information as to the sex and development of ovaries, if any, in this fish, for a question yet unsolved is whether the California salmon will deyelop spawn in frosh water or not. It is known that where ripe eggs have been found in this fish when confined in fresh water.

fined in fresh water,

Work of the Connecticut Fish Commission.—Dr. W. M. Hudson, of Hartford, one of the Fish Commissioners, gives the following particulars concerning the recent operations of the Commission. During the spring 58,000 young Penobscot salmon were placed in the tributaries of Farmington River. Of land-locked salmon eggs 91,000 were hatched and distributed. The demand for these young salmon to stock ponds and streams was very great, as it had become known that salmon weighing from two and a half to four pounds each have been taken in Hog Pond in Lyme, in Snipsic Pond in Rock-ville, in long pond in Winchester, and in Twin Lakes in Salisbury, and in many others the young fish are known to be growing and thriving finely.

The 110,000 brook trout latched were widely distributed and the supply was by no means equal to the demand. Arrangements have been made to secure 400,000 young fry next spring. Dr. Hudson says that Connecticut has some of the finest trout brooks in the world, and with proper care and attention on the part of farmers, and a disposition on the part of anglers to save only those of six inches in length or over, our depleted streams may soon be restocked, so that trout shall be as plenty and large as thirty years since.

A test has been made this serving of the practiculative.

ers, and a disposition on the part of anglers to save only those of six inches in length or over, our depleted streams may soon be restocked, so that trout shall be as plenty and large as thirty years since.

A test has been made this spring of the practicability of hatching shad in the Connecticut waters. Heretofore all the hatching shad been done on the natural grounds at Holyoke Dam, but the committee on fisheries of the last Legislature expressed a desire that all the work for the year be confined to this State. The commission employed Jas. Rankin—formerly fish commissioner—and R. B. Chalker, to test the matter if a sufficient number of spawning shad could be procured. The attempts were made at Wethersfield, Brockway's reach on the Connecticut, and in the waters of Long Island Sound near the mouth of the river. The experiments were made under adverse circunstances—a long, protracted drouth, low river and high temperature of the water. With the exception of a few thousand young shad hatched at Wethersfield the operation was a failure. The shad taken were found to be immesture, and any attempt to preserve them until ripe in fresh water resulted in their speedy death. It was found, however, that shad taken in salt water in the pounds could be preserved alive and that the females eventually ripen thoroughly. The sharks made sat havoe with this pen, and it was found that the male shad invariably escaped through the holes made by them, so that having three or four ripe females no male could be obtained to test the experiment whether the eggs taken and impregnated under the circumstances would be hatched in salt water the fishermen claim that these pens can easily be protected against sharks by an outside netting a few teet from the pen thanks had sea have on many each of the extended into the extended of the protected against sharks by an outside netting a few teet from the pence and the successful propagation of young fish. The fishermen claim that these pens can easily be protected against sharks by an outside the purpose, impregnated, and then taken up the river to hatch in the fresh water, and then develop healthy young fish.

A RECORD OF HATCHING BROOK TROUT.—Council Bluffs, Iowa.—I send you herewith a record of some brook trout hatched during the present season for my individual use, thinking it may be of some interest to your numerous readers. It is as follows: Jan. 20th, 1880, I received of W. L. Gilbert, of Plymouth, Mass., 5,000 brook trout spawn, which arrived here in splendid condition, there being a loss of only sixty eggs while in

transit. I regret that I kept no record of the amount of loss during the process of hatching, but am safe in stating that it was no greater than that sustained in the laatch, of which a record is herein given. On the 18th of Pebruary I received from the same place 10,000 brook trout eggs, which were all hatched in twenty-seven days from the day of arrival: a record of which is as follows: Received, Feb. 18th, 10,000 brook trout eggs; temperature on receipt, 35°F.; temperature of water in which they were to be hatched, 54°F; amount of eggs picked, 140. Feb. 19th, picked 25; Feb. 20th, 10; Feb. 21st, 10; Feb. 23d, 7; Feb. 24th, 4; Feb. 25th, 5; Feb. 26th, 5; Feb. 27th, 3; Feb. 28th, 6; Feb. 29th, 5; Feb. 27th, 3; March 3d, 2; March 4th, 1; March 5th, 3; March 6th, 2; March 7d, 1; March 11th, 1; March 15th, 1; March 15th, 1; March 11th, 1; March 15th, 1; March 11th, 0; March 11th, 1; March 11th, 2; March 11th, 1; March 11th, 2; March 11th,

It will be seen that the above statement includes the loss sustained in transportation, and the young fry that died in course of and immediately after hatching. I will also state that no deductions are made for unimpregnated eggs; notwithstanding all this, it will be observed that my hatch is something in excess of ninety-seven and a half per cent. The temperature of the spring in which this hatch was made was 51°F, during the entire time. The water, although never rolly, deposits a great deal of sediment in the form of a sandy learn. These eggs were latched in the Shaw hatching-box, the entire paraphernalia of which, including the wire screens, are well painted with coal tar. The eggs were in different stages of development at the time of transportation. The 5,000 eggs above mentioned were packed in four layent stages of development at the fine of transportation. The 5,000 eggs above mentioned were packed in four layers of about equal quantities; two of these were much further advanced than the others, and bore transportation much better, there being only three spoiled eggs and

further advanced than the others, and bore transportation much better, there being only three spoiled eggs and two dead fry.

The young fry from all the above-mentioned eggs are now in a fine, healthy condition: those from the first lot are beginning to feed quite freely, and have fed more or less for the last two weeks. Heretofore I have never given food until the unbillied sac was nearly absorbed, but with the above-mentioned fish I began feeding at a much earlier period than is usually practiced. The young fry, very shortly after they were hatched, I took off the trays and placed in troughs, where the sediment of which I have made mention, was allowed to accumulate, and I gave them for the first few days a slight sprinkling with common salt, and then gradually increased the quantity unfil now I give them sufficient to form a perfect bed on the bottom of the troughs. This had the effect of perfectly cradicating all signs of dropsy, or blue sac, a disease to which, I believe, all young fry, from eggs that have been transported from a distance, are more or less liable.

WM. A. MYNSTER.

from eggs that have been transported from a distance, are more or less liable.

M.A. Alynster.

MIACHING THE "ANGLER," OR "FISHING PROG."—
Glowester, Mass., Ang. 2d.—Some interesting experiments are being made in hatching the goose fish, monkfish, or fishing frog (Lophius piscatorius), at the station of the United States Fish Commission in this place, by Mr. A. Howard Clark, who has charge of the station, and much valuable information concerning the embryonic and early life of this natural angler has been obtained. One visiting the station can see the eggs in several stages of development, as well as the young fish that have been hatched. In the early stage the eggs are held together by a glutinous substance, which, floating in the water, looks like a thin sheet of jelly thickly dotted with small whitish beads. These sheets are from thirty to fifty feet long in their attural state, and float near the surface. The next period shows the embryo formed in the egg, and so on until we come to the fully formed fish taken from the hatching box. The nicroscope shows that the little wiggler has absorbed the untilitien bag, and also that there is a good development of mouth, which, in the full grown fish, is the most striking feature, and the extraordinary capacity of which makes it possible for these creatures to take in their neighbors, the other fishes, in such a cold blooded manner. It would be interesting to know just how these "anglers" manage to procure their food from early balyhood until they arrive at that age when they can bury themselves in the mud and patiently wait for their prey to be attracted by their lures within easy reach. But this, together with nucle more concerning the lives and habits of the deep sea fishes, of which so little is now know will undeubtedly be note fully understood in the future through the patient researches of those engaged in this field of scientific investigation. J. W. C.

INCREASE OF SALMON IN McCLOUD RIVER.—Schnon have never been so numerous in the McCloud River, Cal., since it has been known as they have been this summer, especially about the middle of July, a fact which may be attributed to the work of the United States Fish Commission. Recently Mr. Stone caught seven hundred salmon at one haul, in the open river, and in 1872 and 1873 it was raw that fifty were so taken. The water in the river is higher and colder than it has been since operations were first begun there, and it will be interesting to see how this will affect the spawning of the salmon.

EGGS OF CALIFORNIA TROUT.—The prospects for a fair supply of eggs for the rainbow trout, Salmo iridea, is very good. Last month Mr. Stone fished mght and day for breeders, in the McCloud River, and before the season closes may have two thousand of them, which will average three pounds cach. These should yield, if no accident occurs, about 500,000 eggs. Over 60,000 young treat were turned into the river this spring from the United States hatching station.

Success of the Augusta Fishway.—A 19 poind salmon was captured at Waterville, Maine, Tuesday July 6th, the first since the fishway was opened at Augusta. The Waterville Mad is bappy over this capture, and says further:—"Three were seen last Sabbath, and several surgeon are reported to have been seen jumping in the bay. This is evidence that the fishway at Augusta dam is a success; and the prospect is good that with fishways in all the dams above, and with proper rules and regulations, the fish may be restored to their old haunts."

DISCOVERY OF MENHADEN OIL.—According to United States Fish Commissioner Baird, the world is indebted to

a woman for the discovery that the oil of the "menhaden" has much commercial value. About the year 1830 Mrs. John Bartlett, of Blue Hill, near Mount Desert, Maine, while boiling some fish for her chickens, noticed a thick scum of oil upon the surface of the water. Some of this she bottled, and when on a visit to Boston soon afterwards she carried samples to one of the leading oil merchants of that city, who encouraged her to bring more. The following year the Bartlett family industriously pied their gill nets and sent to the market thirteen barrels of oil, forw hich they were paid at the rate of \$11 a barrel, in all \$143.

their brethren. As might have been anticipated, the trout fishing was poor, but the few obtained were of good size, and were, I think, Salmo clarkii. I have tried to settle the question whether, as has been asserted, the salmon in the Columbia refuse the fly and spoon in the summer months only because of the discolored condition of the river water. To do this I have ished in the upper tide waters of the Klaskanine and Young's rivers, beyond the flow of the river water, but where I have often seen salmon leaping. I have been entirely unsuccessful in attracting their attention, though I have used spoons that last September took four in an hour. I think the truth is, they will only rise to the fly or spoon in water that is clear and salt. In the fall, when the river is low and the tides high, the salt water comes up as far as the city front of Astoria, and that is the highest point at which a salton has been hooked within my knowledge. Last fall I tried them of Tongue Point, four miles above the city, and though they were leaping all around, they they would not touch my spoon. While speaking of suckers, I should have said that no one knows whether they come from the sea, or whether they are a river lish, living on muddy bottoms and in tide-land streams, though the latter is thought to be the case. I have no means of knowing whether they are found to any great distance inland, but have been told that they are as high as the Clarkanus.

\*Salmon certainly take the hook in the upper waters of the Sacramento, in the mountain streams. D. S. J.

However formed on the essulf face of the Rishamine, and party of the regard to these fallers are not stream, and the stream of the properties of the properties.

They were formed on the essulf face of the Rishamine, and party cales me the stream of the properties of the propert

age, that must have been peculiarly aggravating to the feelings of our hero, he disappeared beneath the cold. dark waves. At this instant—now mark the strategic cunning of this most subtle fish—when I was utterly enervated, and entirely unprepared for the conflict, a fuvorite scarlet bits, and at terrific speed bore down the rapid current. Bracely I rallied my forces to the rescue, but ere my nerveless hands had found their cunning and checked his headlong rush, he had forced from me full fifty feet of line. As soon as he felt the killing strain he leaped high in air to recomnoiter the battlefield, and when he discovered who was in command, and caught a glimpse of the vengeful fire in my eye, he became demoralized, and commenced a series of wild rushes and towering leaps that nearly broke my heart; but all in vain were his frantic struggles, for, as I have said before, I was a desperate man that day, and although fearful odds were against me, "with an energy born of despair" I fought the battle to the bitter end, and at the end of forty-five minutes of agonizing plessure, mingled r' I fought the battle to the bitter and an at the en forty-five minutes of agonizing pleasure, mingle h cruel doubts and fears, during which I would hav for the landing not which I had left at home, I say half for the landing net which I had lett at home, I saw his silvery side turn up, and unresistingly drew him within reach, and thrusting my finger into his wide open mouth safely landed the gallant fish, and with unspeak-able happiness in my heart bowed in acknowledgment to the vociferous cheers that greeted my success. The fish having now learned to their cost that, not-withstanding my crippled cendition, I was more than a match for the best of them, wisely abandoned the con-

test and let me alone, but ever and anon the music of the humming reel and the pleased ejaculations from the adjoining boats proclaimed abundant sport, and kept me pleasantly occupied till nearly dark. I counted no less than twenty-seven noble fish taken by my neighbors, not including many more that were under size, while many of the handliners lost quite a number of apparently heavy fish. The most taking fly is the scarlet ibis, although almost any of the common trout flies, particularly the different shades of brown and orange, have proved successful.

The senson opens as soon as the fish arrive, which is about the last of May, and closes Ang. ist. The present test and let me alone, but ever and anon the music of the

The senson opens as soon as the first arrive, which is about the last of May, and closes Aug. 1st. The present season has not been as successful as usual, owing to low water, yet many fine fish have been captured, some of them turning the scales at upwards of six pounds. I shall try them again in a few days, if I find that tip, and see if there is any sport to be had in "casting," and will swarf success.

STADOW. I find ... 'casting," and Shadow. report success.

Another correspondent writes from Hartford, Conn. July 24th:-

July 24th:—

In your issue of June 24th you published a few notes of mine on shad fishing. I have been trying it again, and this time with much more satisfactory results. I managed to land four in a couple of hours, and should have had more except for a broken hook. I took them with a very light trout rig, and right royal sport it was. My first one took me twenty minutes to land, and the others from ten to fifteen. While not quite so vigorous at the outset they last longer than the black bass; otherwise they reminded me much of that fish in their wild rushes rery light troot ray. So that the content of the content from the tof lifteen. While not quite so vigorous at the outset they last longer than the black bass; otherwise they reminded me nuch of that fish in their wild rushes and their way of throwing themselves out of the water. I hope some of your readers will pay a visit to Holyoke next season, as I am sure they will like it, if they have the good luck to haul in a few of the beautiful blue and silvery fellows. They have all the good points of a true game fish. They take a fly, fight hard, require considerable skill to handle, and are gamy to the last, besides being very handsome. As to their table value I need say nothing. I found a red libis and a coacliman the only flies they would touch.

M. D.

would touch.

FISH IN MARKET.—The first whitefish (Coregonus) of the season made their appearance in Fulton market this week. They came from Erie, Pa. The week was also notable for the first appearance of salmon trout, from Buffalo, N. Y. Spanish mackerel made their appearance on the New Jersey coast last Sunday, about one month later than usual; the market is well supplied. Bluefish are scarce; those in market mostly come from the Massachusetts coast, about Cape Cod. Sheepshead are not plenty, a few being taken off Barnegat. The following are the quotations: Salt water fish—Bass, 25 cents per pound; bluefish, 8; salmon, 40; mackerel, large, 18, small, 10; weakfish, 10; Spanish mackerel, 25; green turtle, 124; halibut, 18; haddock, 6; kingfish, 25; codfish, 8; blackfish, 124; flounders, 10; porques, 10; secabass, 18; pompano, 75; cels, 18; lobsters, 10; sheepshead, 25; soft clams, 40 to 75 cents per 100; soft crabs, 8; to \$1.50 per 100. Fresh water fish—Whitefish, 124; salmon frout, 18.

Trout, 18.

X BLACK BASS NOTES FROM "AQUADALE."—I rarely read a FOREST AND STREAM without finding something interesting to note. The first "point" in last week's issue which I note is the controversy about Southern trout, utias bass. I snot "St. Clair" a little wild in the assertion that "there never was a black bass in any stream that empties into the Atlantic, south of Maryland, and there never will be?" I have in my black bass pond some fine specimens, which I myself brought from the Shenandoah and the Potomac, and I also had some fine specimens on exhibition at the Centennial, which I brought from the Shenandoah. All authorities pronounced them black bass. I have been stocking lakes, ponds and streams with them, both in the New England and the Middle States, supposing them the true black bass, or at least the Southern black bass. A friend of mine, who is an expert angler, has been spending more than a year past in Florida, and writes that he has had fine sport catching what they there call trout, but which are identical with my bass.

Speaking of my bass pond reminds me of an incident which occurred a few evenings ago. There are in this pond perhaps 100 Calitorini salmon, three years old. They appear to be about sixteen inches in length, perhaps some of them are longer. It was about dusk of the evening in question that a party of ladics and gentlemen were watching the resource but the securice but!

haps some of them are longer. It was about dusk of the evening in question that a party of ladies and gentlemen were watching the swallows taking their evening bath. There were barn swallows, bank swallows and swifts, commonly called chimney swallows. One of the latter glided swiftly along the surface of the water, and had barely left it, when a large salmon sprang after it, com-

ing entirely out of the water, but by the time the fish was out of the water the swift was fully three feet away. I am frequently in receipt of inquiries as to the preparation of lakes and ponds for brook trout. The last mad brought me such an inquiry from one of the prominent daily papers of your city. I wish here to repeat what I brought me such an inquiry from one of the produced daily papers of your city. I wish here to repeat what I have for years past maintained, viz: that brook trout will not thrive in lakes or ponds. They only thrive well in water which is undergoing constant aeration. They will live in pure, cool water, like ponds, ditches, etc. but will not thrive without a constant supply of artifications. They would be supplyed to the product of the pro but will not thrive without a constant supply of artin-cial food. Time, labor and money spent in preparing ponds, etc., for brook trout or for stocking such prepared waters with them, will be nearly a dead loss. Partics having suitable sites for such prepared waters should turn their attention to the black bass or the food carp. I have been interested in the various articles concern-ing "sights" of hunting rifles. Those of your readers

I have been interested in the various articles concerning "sights" of hunting rifles. Those of your readers
who used to know me during and previous to the war
can judge whether I am an "authority." For several
years I did most of the gun-repairing for many miles
around the place where I then resided. I experimented
extensively with rifle sights, and had many rifles brought
to me to resight. We best success was with a high. extensively with rine signis, and man many rines oronging to me to re-sight. My best success was with a high, level back sight, usually made of soft iron, colored a dead blue, and containing a narrow and shallow noteh. My best front sights were of ivory, thin and high, and shaped liked an inclined plane, tho back end nearly ver-

Noticing in a late issue of the Forest and Stream Noticing in a late issue of the FOREST AND STREAM some queries in regard to fly-fishing for shad, I will say that a few weeks ago I saw several fishermen having fine sport just below the celebrated Holyoke Dam, on the Connecticut River. They were all fishing with light colored flies, and were taking shad running from two to three pounds and upward.

MILTON P. PIERCE. Aquadale Ponds, Wenonah, N. J.

The black bass question may now be considered as set tled, so far as their distribution in the South is concerned. The very able letter from Dr. Henshall, in our last issue, presented the facts on which all ichthyologists agree, so that even our friend "St. Clair" must see that the bass of the South and those of the North are identical, and that there are but two species. "St. Clair" has evidently been misled by common names, as he mentions the "black bass of the North" as Centropristes atrarius, which is a sea fish, which never comes into fresh water. This fish has many local names, Gill giving black sea bass, sea bass New York); black perch (Mass.); black bass, black fish (New Jersey); bluefish (Newport); black harry, hannahills (New York, DeKay); black will (Eastern shore of Virginia).

Dr. Henshall will soon publish a book on the black basses, a group which this able ichthyologist has been studying for some time.

basses, a group which this able ichthyologist has been studying for some time.

\*\*THE BASS QUESTION SETTLED.—Putnam, July 18th.—The correspondence of SETLED.—Putnam, July 18th.—The correspondence of SETLED.—Putnam, July 18th.—The correspondence of SETLClair, "Black Bass vs. Trout," is rather laughable. He says he will stand or fall on evidence, etc., pertaining to black bass being found in Southern streams. Now he will surely have to tumble over this time. In Western Florida there is a stream called Mud River—why it shoud be called by that name I cannot conceive—for it is beautifully clear, about three miles long, and starts from a large, round, deep spring, which, as is estimated, voids 100,000 cubic feet per minute. The water is clear and cold, and pleasant tasted; the river averages 50 yards wide and is swift, and from ten to twenty feet deep, emptying into the mouth of the Wichawacha River, near Bay Port. The river abounds in bass of two kinds, a kind of lead colored bass often called black bass, and the real black bass. Now I have caught the black bass in Central New York, and New England, for the past thirty years, and am very familiar with the fish, and think I cannot be mistaken; am sure beyond a doubt in my own mind, as experience is one of the best of schoolmasters. Ascending this "Mind River," so called, at about half way from its mouth on the south side is a swife stream twenty feet wide; ascending this some 200 yards, you enter a large kind of pond of some ten acres of rocky and sandy bottom. Here the true, real, gamy black bass abound. One morning I caught about thirty there, of from one to three pounds weight, the same beautifully proportioned, exactly like those I caught in Central New York. Mr. St. Clair says the "vexed question shall be forever set at rest." A colored preacher in Florida said "florever was a mighty long word, reaching half way up the hill of eternity." "That there never will be a black bass in any Southern streams emptying into the Atlantic," is strong language for our able co

See our remarks on the article by Milton P. Pierce. There are but few men who are capable of deciding on species-certainly those having no knowledge of systematic ichthyology are not-the fisherman and angler only knowing their fishes by their superficial appearance, color and shape. Few of them can tell how their fins are situated or how they are composed, character and situation of teeth, or the many other important points which are of real value. The scientist often doubts his diagnosis, while the amateur never does.

The Ling in Montana.—Upper Maria River, M. T., July 3d.—Editor Forest and Stream:—Yesterday an Indian boy brought me a fish which he killed with his bow and arrow. And as I never saw or heard of anything dian boy brought me a usu with a mean of anything and arrow. And as I never saw or heard of anything like it, I will describe it, and perhaps some of your readers will be able to tell us something about it. Length 10 inches, one fin on each side just back of gills: just back of throat-latch two long, feeler-like fins; 5 j inches from nose on back one small fin; 7 inches from nose on back and belly a fin commences and runs clear to tail; tail shape of a flat spoon; general color, a dirty white and black mottled, bright narrow green stripe on each side;

no scales. Kipô, the Indian trader, says he has seen these fish in the Missouri River which would weigh twenty-five pounds; but knows no name for them. The Blackfeet call them Peeksas-mah-meeks, which means and in truth they look like a cross naka-fish

snake-fish, and in truth they look like a cross between a bullhead, a snake and an cel.

The Piegans have been hunting about here for several months, consequently deer and antelope are scarce. We are making preparations to move to the mouth of the Muscleshell River, alout two hundred and fit to niles below Fort Benton, where Kipp will start a trading-post with the Bloods, Blackfeet, Piegans and half-treeds, Butfalo are plenty down there, also all other game to be found in Montana Territory, except Rocky Mountain reasts and mosse.

goats and mose.

The fare from Chicago to Fort Benton is only about \$60. I should be glad to see some Eastern sportsmen come up to our new post next August, and promise them a hearty reception, the best of hunting and iots of fresh, pure Montana air.

I notice a mention of old Liver-eating Johnson in one of room but issue. He is nothing add but is still tennos.

I notice a mention of oid Laversaming admission in oid your late issues. He is getting old, but is still "game and is camped somewhere between the Muscleshell or Judith rivers, hunting buffalo. I do not think he is die ing on Sloux Indian livers late years. APWECUNNA.

Your description agrees with the fish which bears the following names: "Eel-pout," in Ohio: "ling," many parts; "losh," among Canadian fishermen, and other names. It is one of the family Gautidae, the codfishes, and has been called the "codfish of the lakes" Its true name is Lota maculosa. Its livers are said to be a great delicacy.

a great deficacy.

Probably A Sucker.—Walton, Grand Traverse County, Mich.—Every spring and summer I have caught a few fish, the species of the sucker family. In shape they resemble the pike of our western ponds. Their nose is nearly on a right line of their backs, which is very nearly straight. They are broad shouldered; their fins are of the color of gold, and they have a dark line running from the point of their gill to the fork of their tail. They bite a fly as readily as a grayling; weight generally about three pounds. The covering of their gills and their head proper are of a sundown tint, interspered with violet, and all the scales are capable of exhibiting several bright tinted colors. I took one in the month of April and thought I would try his qualities in the pean, and was let, and all the scates are capatite or examining section bright tined colors. I took one in the month of April and thought I would try his qualities in the part, and was surprised to find his flesh a bright orange color when cooked, also to find his anatomy to contain only the same number of bones as a brook trout, only smaller in proportion, and the best flavored fish that I ever at. I think he is the Roman mullet of Pliny. Your fish is probably a male of some species of sucker

in its breeding dress, but your description is too incomplete to base even a guess upon. Again and again we say, color counts for very little in determining fishes,

say, color counts for each state of all.

Give us the color last of all.

SALMO WILMOTL — treat, Can., June.—Editor Forest and Streem :— I wing and stuffed specimens of a salmon bearing the above oame were exhibited at the Grand Dominion Exhibition held at Ottawa in September, 1879. I have searched through several works on American ishes, but cannot find a species named Wilmott. Fun held to make this inquiry because I asked Mr. Wilmott's resistant who named the salmon Wilmott. He informed me that Mr. Wilmot was the authority, he having named the fish in honor of himself! I am not aware that Mr. Wilmot was the authority, he having named the fish in honor of himself! I am not aware that Mr. Wilmot have first in the same of the property and the salmon is accordance with the views of true promoters of natural science that the usual eriquette should be violated to satisfy any man's vanity. If Mr. Wilmott salmon is a good species, it should be described properly, and until this is done, the name is worthless.

W.M. COUTER.

There is no fish known to naturalists by this name, neither has there been any description of a new salmon from that region published lately. The salmon found in Lake Ontario and its tributaries are Salmo salar

MICHIGAN FISHING RESORTS.—Cheboggan, Mich., July 21st.—Nearly every week some person is asking in your paper where they can spend the summer, and at the same time have some good fishing. If they will look at the map of Michigan, they will see that our county is the extreme northern county of the lower Peninsula, and I think were they to pay this county a visit they would be perfectly satisfied, as the weather during the summer months is cool and bracing, and the fishing is second to none. We have good hotels in the town, and at the head of Mullet Lake is one of the largest and best hotels in the State. It was built during the past winter and spring, by the Smith Bros., at a cost of thirty-five thousand dollars. It contains one-hundred and fifty rooms, and is furnished throughout in the very best skyle. It is managed by Wm. Spencer, who has had several years' experience in the hotel business in this county, and can post his guests about the best fishing grounds, and will spare no pains to make them comfortable and feel at home. There is a steam yacht and two saling yachts, besides a fleet of clinker boats for the use of guests. There is a daily line of steamers running from Petoskey, through Crooked, Burt and Mullet lakes, to Cheboygan, then across the straits to Mackinac. The boats need at noon at the Multet Lake House, when the passengers get dinner. Pigeon and Indian rivers empty into the lake about one mile apart, and the hotel is situated about midway between the two vivers, on what is called Pigeon River Bay. In Indian River and this bay there is good troiling for pickerel, black bass and maskalonce. Pigeon River Bay. In Indian River and this bay there is good troiling for pickers, black bass and maskalonce. Pigeon River Bay. In Indian River and this that the sportsman in the Ganes easen can spend his time very pleasently will-out much exertion. MICHIGAN FISHING RESORTS.—Cheboygan, Mich., July the game season can spend his time very pleasantly out much exertion.

THE CHEMUNG RIVER AND SODUS BAY. - Eloviro, N Y., "THE CHEMING RIVER AND SODUS BAY,—Filmer, A. 1., July 30th.—In response to your letter of inquiry of yesterday, relating to the sort of fishing to be had in this vicinity, I report as follows:—
Our river—the Cheming—was well stocked with black bass four or five years ago. As a result of that planting, we have had fair fishing for the past two years. Restate

taken in moderate numbers (upon "dobson," spoon and fly) of from one to four pounds weight. Some fine catches have been reported within the past few days. The fish are by no neans abundant, but seem to be in sufficient numbers to afford fair sport.

The best fishing grounds near us are at Sodus Point, on a bay communicating with Lake Ontario. It is a five hours' ride from here on the Northern Central Railway to Stanley. there on a branch road to Sodus Point. You leave Elmira at 12:20 P.M., and reach the fishing grounds by 6 P.M. Black bass and enormous pickerel abundant. Am this day in receipt of a box of pickerel from there, caught by my son and a companion, containing twenty fish from two to four feet long. They were caught in one afternoon by trolling from a boat, with a spoon. Accommodations ample and good, at a neat spoon. Accommodations ample and good, at a neathout charging \$7 a week. A boat can behired for \$3 a week. Boat, and boatman to row you, \$2.50 per day. This is the best point for fishing near us.

Weakfishing on the New Jersey Coast,—Forked River, N. J., July 31st.—The delightful time and good sport I had here last year induced me to come again, and I have been here for the last two weeks. The fishing has been and is very time. For one week I fished, averaging fifty or seventy-five fish a day with the rod, chiefly weak fish and sea bass, the largest day being 113 fish to two rods, with an occasional bluefish, which makes your reel spin around. The weakfish run from one to four pounds, with a great many two and three pounders. Yesterday, though fished out myself, I took a friend out who had just arrived. Our catch was 102. My friend got a small bag of suipe. I broke the lever of my breech-loader on the way down the bay and could not fire a shot. Probag of snipe. I broke the lever of my breech-loader on the way down the bay and could not fire a shot. Provoking, wasn't it? Snipe are beginning to come, and we found several whisps "trading," as the baymen call it, along the surf. They were surf-snipe, robins and dowitchers. There are a few scattering yellow-legs, but they have not yet cone in large numbers. I shot five dowitchers day before yesterday, which I saw from the piazza on the meadows opposite, in about twenty minutes. The charge for boats, unlike most seaside resorts, is very moderate.

TROUT IN THE FRENCH BROAD.—A Washington correspondent writes us: "I have spent some weeks in Western North Carolina about Asheville, the warm springs on the French Broad and ascending the mountains Black Dome, Craggy, etc. The scenery is magnificent. Not quite so rugged in some way as the White Mountains, or Adirondacks, owing to the higher timber level, due to the latitude, but the mountains are higher and in such profusion—so many high peaks. As to the fish, I unfortunately made little inquiry, as I was too much occupied otherwise. I caught trout, though, in the small mountain streams. Most of the nocuntain streams, I think, have brook trout in them. The French Broad, a most beautiful stream, has probably bass. If no one answers your correspondent in the meantime, I can perhaps get him the information shortly."

The Greenener River.—Washington, D. C., July 30th.—I have heard from my old place at Ronceveck, W. Va., that the Greenbrier River is affording good bass fishing this season. The Superintendent of our mill there wrote to me to send him such a rig as he had seen me use there, so that he might try the deceptive fly upon the fish. The latter, he says, run from a foot to as big as you can manage to get hold of. I notice one of your correspondents asks about trout taking a fly in West Virginia in July. Of course they take a fly, but I have found that (having fished West Virginia streams every season from 1870 to last year) in the latter half of July and early part of August the fly-fishing is not as good as later. Late May and June, of course, are best, and then late August. The season expires Sept. 1st. C. CLAY.

The Brandywine.—West Chester, Pa., July 31st.—Bass fishing has been discouraging here until since the recent heavy rains, but now that the waters are begining to clear numerous instances of good catches are heard daily. Three and a half pounds appear to be the highest weight of any single fish so far as heard from, while the majority of the fish run considerably below this figure. Young toads, nainnows, crabs and helgrannites are the most taking baits, yet the bass, when hungry, seem willing to accept anything that is estable. Have not heard of any being taken this season with the fly.

S.

Salmon on the Upper Jacques Cartier.—I should like to ask some of your correspondents in Quebee, who have fished the Jacques Cartier River, whether they have ever taken smolt in the upper reaches of the river, and if so, how they account for their presence there, as the river has never been stocked, and the salmon do not ascend above Sullivan's Falls. At least, I have never heard of salmon having been taken or even seen above this fall. For over ten years I have taken these smolt in the rapids, and have been much puzzled at finding them there. Can it be that during the heavy spring freshets some few salmon succeed in surmounting this fall? It seems almost incredible, as there is a dam ten feet high right at the head of it. SALMON ON THE UPPER JACQUES CARTIER.-I should like

A BIG BLACK BASS FROM THE THOUSAND ISLANDS A BIG BLACK BASS FROM THE THOUSAND ISLANDS.—I send you by express this morning a bass caught with hook and line, weighting six and a quarter pounds, which I think is the largest bass I have ever known taken here. The fishing is good; as many as one hundred were taken in a day with a single fly. The small fish that were here in June have entirely disappeared, hence the fishing has improved. Very truly yours, S. D. JOHNSTON. Clayton, N. Y.

in a day's fishing. The prospect for good shooting this fall is flattering. Numerons covies of young blue grouse lavo been seen, and in the marsh below here, young mallards are by hundreds. Pigeons seem to have described our county, as I havo not heard of over a dozen being killed this spring. The young of the ruffed grouse are half grown, and are feeding on blackberries. I.G.S.

BASS FISHING IN THE POTOMAC.—Leesburg, Va., July 30th.—Before this muddiness in the Potomac, I took at the head of Harrison's Island, in the rapids, nine bass with the caledonian minnow and one bass with the fly, and next day seven with caledonian and one with the fly. swung the minnow up and across the current, and s it obliquely down with a fly rod. Had I had a stiffer I would have landed more.

A RARE FISH.-Mr. E. G. Blackford recently had a A BARE FISH.—MIL E. G. DRESHOUL PECCHLY MAN A specimen of an African pompano, Trachgnotus governits, upon his slabs in Fulton Market, New York. It weighed sixteen pounds, and was served up on Coney Island.

#### THE DITTMAR POWDER ACCIDENT.

NEW YORK, July 26th.

Editor Forest and Stream:— We transmit you herewith our Mr, Von Lengerke's report upon the Nash powder, and we adopt his suggestion to invite you, or any representative whom you may name, to accompany him to Springfield, or any other place agreed upon, where the most reliable instruments can be found, or to witness his practical tests proposed in his letter, to verify the report, and we will bear the whole expense of the trial. Editor Forest and Stream:

DITTMAR POWDER BANDFACTURING COMPANY:—
GENTLEMB:—In compliance with my understanding of your learne, Helt for Binghannton on the 12th inst. 1 arrived there on the morning of the 15th.

I employed the day in testing the sample of powder which I received from the FOREST AND STREAM, sent to them by Mr. Nash, and of which they retained one-half.

I am glad to say that the powder has no exceptive strength, and hat the accident reported can not have been the lattle of the lowder.

When the state of the state of

First train—the gauge snowed a pressure of 25,000 hounds. Second train—the gauge showed a pressure of 25,000 hounds. I reverse the testing block, twice pressed, and the third showed to the show the powder down as much as nossible, and heaped to measure a little, and the fourth trial showed 32,000 pounds; is eithir trial, 35,000 pounds. I then filled the measure regularly, weighed the same, and also aded another charge of the same weight, without regard to ceasure. The result was: sixth, 24,500 pounds; seventh, 27,000 junds.

loaded another charge of the same weight, without regard to measure. The result was sixth, 43:50 pounds, eventh, 27,00 pounds.

The result was sixth, 43:50 pounds, eventh, 27,00 pounds.

The life origing pressure of all these charges is about 28,00 pounds, that is possible the property of the control of t

J. VON LENGRIKE.

We wish to make a personal explanation to Mr. Nash.
We have never doubted the fact of an accident nor publicly questioned his description of it. It is true, as you,
Mr. Editor, have said, that no two persons ever described
an accident precisely alike, and we are willing to give all
due latitude to anyone writing under the consequent excitement.

I think is the largest bass I have ever known taken here. The fishing is good; as many as one hundred were taken in a day with a single fly. The small fish that were here in June have entirely disappeared, hence the fishing has improved. Very truly yours, S. D. JOINSTON. Clayton, N. Y.

The bass weighed six pounds on arrival, and proved to be a big-mouth (Micropterus pullidus), in fine condition. It had a catifish eight inches long in its stomach.

Orkson—Eugene City, July 22d.—Fishing on the McKenzie River, twenty miles above here, is good, and nearly all of our anglers are camped on the grounds. Recently two men fishing from a skiff caught minety-five trout, which weighed over ninety-five pounds, in a day, and its nothing unusual for a sportsman who is well up to the business to land one hundred and fifty mountain trout.

that given by the Nash powder, and the latter falling saveral thousand pounds below our standard powder, and below the best brands of American sporting powders, we can only ask, what cansed the accident?

We adopt the suggestion of your editorial in your issue of the 15th inst., in which you say: "We think the present company are bound to warn the public, by every means in their power, against the powder manifactured by the old company or companies, since it is evident that this old powder is or may be dangerous." We positively declare that the Nash powder was not of our manufacture, was not sold by us, and was never in our possession. So far as that is concerned, we are disinterested parties, except insomuted as it bears the name of Dittmar powder, and we think that our tests have abundantly proved that even that was not dangerous, but fell below the powder which we put forward as our standard.

Mr. Nash's suggestion that the can of powder may

but fell below the powder which we put forward as our standard.

Mr. Nash's suggestion that the can of powder may have been tampered with is something which we have nothing to do. If it was, it was not our powder that was tampered with.

We shall, following your suggestion, advertise more fully to the world, that we have never sold, nor will we ever sell without due notice to the public, any powder whatever, either unsealed, unstamped, or without all proper directions for its use; and we hereby caution the public against buying any unsealed so-called Ditmar Powder. Yours respectfully.

DITMAR POWDER MANUFACTURING COMPANY.

We would willingly avail ourselves of the invitation of the Dittmar Powder Manufacturing Company, did we attach any importance to the test proposed as bearing on the point at issue. They by no means show that the accident "cannot have been the fault of the powder," nor do they prove anything, in fact, on the vital question of the safety or non-safety of Dittmar powder. Further than this we must reserve our comments on this letter to another time, and until we have completed our own experiments with the powder.

Saturday Night at the Head of the Neck.—Accomac Co., Va., July 16th.—Editor Forest and Stream:—
There was a great meeting of the "Neckers" at our store last Saturday night. After the boys had spun their yarns, in good order, some dropping quail in crossing a four-foot path, resting their arms on fence rails, killing with their guns" kicking up behind and before," bagging coons, opossums, etc., etc., Uncle Mike Jones put in an appearance by stating that his father lad often related to him the prowess of his grandfather in the use of a gun, which he had imported from Holland, known as "the old pewter piece," and, amongst other things, described his wholesile destruction of blackbirds on one occasion, when he swung her around an oat stack, and killed all the way around, the charge terminating in taking off the skirts of his long-tailed blue, whereupon, being an ardent admirer of old "tangle-leg," he proposed a drink.

ing off the skirts of his long-tailed blue, whereupon, being an ardent admirer of old "tangle-leg," he proposed a drink.

John Bush, whose inclinations had turned, for several years, toward the "biled owl" fraternity, having been a great listener, put in a word, which he said in no way was meant as disputing the flexibility, under curved pressure, of the gun of Mike's progenitor, stated that he, on one occasion, had made a shot somewhat alarming to tell, yet, as there still walked two living witnesses, he would relate that the occasion dad not ariso by putting his piece in a circular attitude, but that he held it straight from the shoulder, and left dead on the sand 350 assorted birds, curlew, snipe, etc., and, in candor, believed that as many more fluttered off, wounded, on the water. Uncle Mike spoke up and asked: "If but one barrel?" "Only one." "What size slote?" "Fours," "Two ounce charge?" "About." "Will some gentleman be so good as to count if there are 700 pellets of fours in two ounces." Now, you see that things began to look rather "cornerfied" for John, and as the old "tangle-foot" was working up to the usual standard, it was plain that something must be done, for the double purpose of staving off muscular action, and to drive the two heroes of-the evening to an alliance, and nothing short of the "Western Farmer" could accomplish that end, so Cousin Burton stated that on one occasion a Western farmer had done wonders without good results, and he would be glad to have their attention to hear it. Silence having been reached, this old coon hunter went on to say that this farmer had constructed a level floor for the purpose of baiting wild pigeons, and after alluring them to his place in great numbers concluded he had better secure some protist for his outlay. With a double charge in his old road heaving and pulled the cord, when lo 1 not one bird was left prostrated on the field, having pulled too late by one and three quarter indics.

"Well," says Mike, "nothing very remarkable about that."

"But I was

But I was going to say that lie swept up nine and a foushels of legs and feet."

half bushels of legs and feet."
"Oh! Come, John, come, s'pose we have just one nip

"I don't want any," said Bush; "that pigeon affair is all that I can carry."

T. G. E.

THE GUN IN ENGLAND .- Mr. Richard Grant White has been discussing English social life, in a series of articles in the Atlantic, and has this to say about English shooting :-

ing:—
Next to the horse in England is the gun. Accustomed as we are to see Englishmen who have crossed the Atlantic to visit America, and whose idea of that tour of observation scens to be to go 2,000 miles to the Western plains to shoot, we yet have no adequate appreciation of the importance which shooting, as one of the occupations of life, has in the minds of tens of thousands of Englishmen. Hunting and shooting in England are not mere receations, forms of casual pleasure, to be enjoyed now and then, leisure and weather serving. In the hunting season hunting men are not content, as I found on talking with some of them, to go out with the hounds

11

once or twice a week. They hunt three or four times a week, and even every day, except Sunday, if possible. I wonder that they except Sunday. For if a man in the country may work in his garden, and a woman in Longdon may cry watercresses on Sunday out of church hours, I can see no reason why these gentlemen should refrain on that day from laboring in their vocation. Their vocation and callingit surely is. It is the business of their lives, and to hear them talk about it one would imagine that it had the importance of an affair of State. Shooting is hardly less thought of, and is more general because it is less cosily. The pheasant, the partridge, and the woodcock are sacred birds provided for solemn sacrifice. "Does he preserve?" is a question that I have heard asked by one country gentlemen about another with as much interest and seriousness as if the inquiry were whether he had a seat in Parliament. An engagement to shoot, like an invitation from the President at Washington, sets saide all others. Englishmen will go from one end of the country to another for a few days shooting; and shooting means, nowadays at least, not a morning's walk with dog and gun in a fine country and the bringing home of a few well-carmed birds and rabbits, but mere gun practice in a park at birds as flying marks. It has lost its connection with the eniownent of next one of the set is connection with the eniownent of next one and set its connection with the eniownent of nature and inwalk with dog and gun in a fine country and the bringing home of a few well-carned birds and rabbits, but mere gun practice in a park at birds as flying marks. It has lost its connection with the enjoyment of nature and invigorating exercise. The "sportsmen" take their stands, and the birds are roused from the gorse by the gamekeepers' helpers, and are shot down or missed as they come within rauge. As I was in England during the shooting season, I had some invitations to take my chance at the pheasants. But I accepted none. I could use the little time I had to spend there in other ways, more to my advantage, and also to my pleasure. As to shooting birds in that business-like Rashion, I would as soon take trout out of a tub. And that, I suppose, will be the way soon provided for the practice of the contemplative man's recreation. The next thing to it seems to be the going to a fishing hotel and angling from a boat in a mill-pond.

Why not fish and shoot by telegraph as well as in this way? The charm of field sport is the field—the early start, the sharp, clear morning air, the sunrise, the walk over hills and through meadows, the country through which the game leads the seeker, the mid-day rest and luncheon with a companion or two by a clear, sheltered spring, whose cool water is tempered by the contents of flasks which counteract the unmitigated effect of that dangerous fluid, the renewal of the search for game by wood-side or brook-side, and the pensive walk home to a hearty dinner, a pleasant evening's languid chat and a well-earned, dreamless sleep. Compared with this, what are preserve-shooting and pond-fishing?

Woodcock Harts.—Waxuyunda, N. Y., July 25th.—While walking about sundown a few evenings since, in a neighboring swamp, giving the dog a little exercise after a long and tedious day on the chain, we found five fine, large woodcock, all of which seemed to be in splendid condition, with the exception of one, which seemed to be moulting and scarcely able to fly at all. I could have caught him, had I wished. He flew about ten or fifteen paces and then settled down, and although we hunted for the bird some time, failed to find any trace of it. I was not aware that woodcock moulted so early and late, as I shot them last season during the months of September and October that were miserably poor and about half pin-feathers. This is a favorite resort for this bird, and also the English snipe. The black dirt of Orange County, of which there are about eighteen or twenty thousand acres, furnishes abundance of food for them during the summer and fall. The woodcock, a little before dusk, leave their retreat in an almost impenertable swamp close by the writer's home, and seek the neighboring cornfield. It is a pleasing sight to those who admire this noble bird to watch the big fellows in their flight to the cornfields last fall during their evening flight, but darkness soon puts an end to the sport, and the woodcock feeds on unmolested, and ere daylight daws is safe in the dark and secluded swamp. The past open winter and dry spring have been excellent for game in this lower. cock feeds on unmolested, and ere daylight dawns is safe in the dark and sectuded swamp. The past open winter and dry spring have been excellent for game in this locality. Quali bid fair to be very abundant. As I write this, two old males sit almost within gunshot of my window, alternately whistling Bob White and guarding broods of young ones of fifteen or sixteen birds about the size of a springer. broods of young ones of fifteen or sixteen birds about the size of a sparrow. They have not been as plenty for a number of years as they are at the present time. Pothunters are not quite so thick in this locality as they are in some, and the farmers, as a rule, are not very expert with the shot gun. Once in a while, during the fall or winter, we hear of a whole bevy being shot on the ground, where they have roosted through the night, by some who call themselves hunters.

WALLKILL.

WODMONT ROD AND GUNG.—Washington, D. C.
July 2d.—Having just returned from a most delightful
visit to the grounds of the "Woodmont Rod and Gun
Club," I beg to report the result of my bass fishing
woodcock shooting during last week's heated term.
The grounds of the club are in Washington County, Md., and
include npward of two thousand acres; fronting for
three-quarters of a mile on Dam. No. 6, the best fishing
point on the Potomac River. The fish bit ravenously at
live minnows, and the sport was simply charming. In
four mornings I took seventy-five pounds of bass,
that gest weighing three and one-half pounds, and the
whole averaging about one pound each. Much larger
fish were caught by others, some running as high as six
and one-quarter pounds, but the larger fish seemed to
avoid my bait. On several occasions we cooked and eat
our fish on the bank where caught, and no one who has
not tried it can appreciate the difference in the flavor of
fish cooked as soon as caught, and those which have
been out of the water for hours.

The rest of my sojourn at the park, when not pulling
out bass, was spent in shooting woodcock, which I found
in great abundance, and in prime condition. With the
aid of my dog Sancho, just purchased of Mr. Chas. P.
Kent, of Binghamton, N. Y., I had no difficulty in bagging a couple of dozen birds during a forenoon. By the
by, I beg there to say that I believe Sancho to be what
Mr. Kent represented him, "the best dog in America."

The Woodmont Park is beautifully situated among the
mountains. On the Westrises the Sideling Hills, some
roof best; on the South, the Cacapon Mountain rises abrupily from the Virginia shore, and on the East, the

Canoloway Mountains loom up, while Woodmont stretches Canoloway Mountains loom up, while Woodmontstretches away to the north, touching the old Cumberland road. The woods are filled with deer, turkey and pheasants. Within a hundred yards of the club-house I counted three turkey hens, and thirty-five young turkeys, feeding as quietly one morning as if they owned the premises. I noticed only three deer during my stay, and one of these was as white as snow. The three moved off quietly into the dense forest. When the shooting season with the control of t our club anticipate some rare sport.

Cobu's Island, Va., July 28th.—The season for scafowl shooting off the coast has opened gloriously thus summer, and promises to continue good until the fall. One hundred to a hundred and fifty curlew and snipe to check any on a tide is of frequent occurrence. We are One hundred to a hundred and fifty curlew and snipe to a single gun on a tide is of frequent occurrence. We are now shooting the first llight of the birds, About the 10th of August the second flight of birds will make their appearance, and rare sport is anticipated.

The duck and geese shooting begins here about the middle of November, and is, I think, the finest on the Atlantic coast.

Sportsmen will find fine quarters on the island all during the winter as well as honest reliable guides, who

Sportsmen will find the quarters on the island an during the winter, as well as honest, reliable guides, who furnish decoys, boats, etc., for \$3 per day. The game can be easily expressed home three times a week.

Those determining to visit the island can take the Old Dominion line of steamers at New York for Norfolk, Va., thence by steamer N. P. Banks to Cherrystone, where they can easily find transportation to the island—some fifteen miles away.

they can easily find transportation to the island—some fifteen miles away.

I have shot over most of the ground in this State, and can conscientiously recommend Cobb's Island to gentlemen sportsmen, for they will find the Cobbs and Tom Spades kind hearted, thoroughly honest and reliable men, who will never seek to overcharge them a cent, and they will find enough ducks to keep them up to the warmest kind of work as long as the winter lasts.

I have no axe to grind in writing this, but simply to point out the place for fellow sportsmen. I have several times written full descriptions, in FOREST AND STREAM, of the island, and the immense stretch of flats known as the Broadwater region of Virginia, or else I would be tempted to let my pen run away with me.

tempted to let my pen run away with me,

Accomac and Cobb's Island,—Accomac, Va., June 20th.—Curlew fly here from the 1st to the 20th of May, and return for about the same length of time in September. With them come all the variety of birds that we have, both transient and stationary. The willet, the American rail, the black head gull and strike breed here, and remain all summer. The ergs of the latter varieties are very numerous, and can be found at the rate of (one man for a day's work) about one bushel per day. Many of the long bill curlew stay here all summer, but in not one instance have I known of their propagating here.

At Cobb's Island there are in summer all the kinds of birds to be found anywhere, whose habits tend to a salt meadow: curlew, long and short bills (the latter called marlins), willet, plover, black breasts, robins, snipe, brown backs, American rail (mud hen) and sand birds. The latter congregate in large flocks, and are down on the seashore following the breakers down and running up as the sea washes back. All the above birds are also to be found here in winter, but not in so large quantities.

T. G. E. At Cobb's Island there are in summer all the kinds of

Powder Measures.—Montgomery, Ala., July 28th.—In your last issue Inoticed a communication from "Member Manchester Shooting Club," in reference to the weights of powder and shot as measured in Dixon's measure. I have used these measures for years, and have often weighed them for other sportsmen, and have found them accurate. I think your correspondent has been misled by the difference between Troy and avoirdupois weights. He says the smallest charge marked on the measure (3 drachms) weighed I drachm 20 grains avoirdupois. Now, I drachm 20 grains avoirdupois is 47½ grains, which would make I drachm of the measure weigh 15.7.0 grains. The largest charge of the measure (5½ drachms) weighed 3 drachms drachms have been supported by the drachms avoirdupois weighs 60.7-9 grains. But the 5½ drachms of the measure weighed 3 drachms (avoirdupois r), which is 82 grains—a discrepancy in the two weights of nearly is 82 grains—a discrepancy in the two weights of nearly

is 82 grains—a discrepancy in the two troughouts of grains.

Let "Member Manchester Shooting Club" take his measure to a druggist and have him weigh the charges in grains on a pair of accurate scales, and he will find them to be as follows: The smallest (3 drachms avoirdupois) will weigh 82 grains, equal to 1 drachm and 22 grains Troy. The largest (54 drachms avoirdupois) will weigh 1504 grains, equal to 2 drachms and 304 grains Troy. Of course these weights will vary a little, as the powder is scant filled, heaped or packed.

Member Montgomery Shooting Club.

favor this new law, but they all respect it, and are eagerly looking forward to September shooting at large, full-grown birds. We are in fear, though, of pot-hunters shooting our quail in mistake for woodcock. But we have a fow of the farmers interested, and they keep a good lookout, and will report to us if any violation is known.

PRAIRIE-CHICKEN SHOOTING ILLUSTRATED. Prairie-Chicken Shooting Illustrated,—A correspondent in St. Louis writes us that the St. Louis Kennel Club has recently engaged Mr. Whitford as trainer, and that he has taken the dogs to Southern Minnesola to work them on chickens. Later on Mr. Tracy, the artist, will join him for the purpose of making sketches for some shooting scenes, which will illustrate the different phases of chicken shooting in a series of half a dozen pictures, introducing such noted dogs of which studies can be obtained.

Missouri—Ironton, July 28th.—This has been a splendid season for game of all kinds. The woods around here are full of deer and turkeys, and quait are plenty. The acorn and hickory nut crop will be good, which will bring large numbers of squirrels in the fall. This is just the place for sportsmen, as they can get good accommodations and have plenty of good shooting. C. W. T.

DELAWARE WOODCOCK SHOOTING,—My communica-tion concerning Delaware woodcock shooting in your last issue should have been dated July 12th instead of July 1st, and the sentence which reads, "but none of them criticised," etc., should read, "but some of them criticised," etc.

#### SHOOTING MATCHES.

Worcester, Moss., Aug. 2d.—The Worcester Sportsmen's Club are going to "pick their filnts," in view of the gathering at Bos-ton, on the 19th and 20th, of teams from all over the State, be-longing to the Massachusetts Association. Special meetings have been called for trial shots at 20 balls.

ASHBURNHAM, Mass., Aug. 2d.—The Ashburnham Rifle Club recently organized, have their range in working order. At a distance of 200 yards from the target stands, a suitable building has been created. This is provided with shelves, telescopes and conveniences for the use of the members. The regular weekly practice of the club will take place on Wednesday afternoons. This week it is expected that several members of the Gardner Club will be present and participate in the shooting.

WESTHORO', Mass., Aug. 2d.—The Natick Glass Ball Club had a match with the Westboro' Glub, Saturday, on the grounds of the Natick Club near Lake Cochituate. The following is the

#### TREATMENT IN CASES OF POISONING.

OUR attention has recently been called to a large number of source for ber of cases of dog-poisoning; but we are pleased to state that the majority of them have been caused by accident and not the result of design. Believing, there fore, that a brief reference to some of the more common and popularly known poisons which our dogs are most likely to suffer, and their antidotes, may be of use to our readers, we quote as follows from Mr. Dalziel's excellent little book on "The Diseases of Dogs:

little book on "The Diseases of Dogs?"—

Perhaps none of our domestic animals are so liable to suffer from the effects of poisonous substances as the dog; his restless and inquisitive nature, and that inveterate labit of routing into every necessible lole and corner, lays him open to it, while the sporting dog, on duty in places where unsportsmanlike practices prevail, is exposed to special danger. Dog-poisoning is either the result of design—where some envious or malicious and cowardly person is the perpetrator—or it is the result of the ignorance of persons administering to the animal drugs of the nature and action of which they are ignorant; or from accident, which, properly interpreted, in most cases means culpable neglig-nee on the part of those having to use poisonous substances for the destruction of vermin or other purposes.

Against the mulicious poisoner it is difficult to provide; being rarely forewarmed we cannot be forearmed, and against accidental poisoning much can be done by using

most cases means cupator negatence on the part of those having to use poisonous substances for the destruction of vermin or other purposes.

Against the mulcious poisoner it is difficult to provide; being rarely forewarned we cannot be forearmed, and against accidental poisoning much can be done by using reasonable care when it is necessary to use poison. The following will cover the great majority of cases: Arsenic, cortosive sublimate, phosphorous, strychnine, cantharides, carbolic acid, and what of late has caused serious trouble, Paris green. As a general rule, for distinguishing between the evidence of poisoning and the symptoms of disease, the suddenness of the attack naust weightargely; and by tracting where the dog has been, and what he has or is likely to have picked up, a pretty accurate conclusion may be arrived at.

The first step to be taken in most cases is to freely empty the stonach by means of emetics, as tartar emetic, sulphate of zinc, ipecacuanla wine, or, if none of these are at hand, by drenching with lukewarm water, and afterwards giving the antidotes indicated, if procurable, but, under any circumstances, give demulcents, such as boiled flour and milk, starch, gruel, milk and eggs beaten up, olive oil, etc., in considerable quantities. A dose of castor oil may also be given, and, if the dog suffer much pain, a dose of opium or laudanum every three hours. Where great depression and weakness follow, stimulants (as ether, wine, whiskey, brandy) should be given in small quantities at frequent intervals.

Arsent.—Spanjtoms: Great heat and pain in the stonach and bowels, sometimes accompanied with swelling, the belly being very tender to the touch; great thrist; frequent vomiting and retching; imore or less discharges of froity saivs: frequent evacuations of fluid, dark colored matter often marked with blood. The animal soon loses muscular power, to a great extent, showing an indisposition to move: the tongue, lips, etc., become red and swollen, and the breathing more and more labored and pain

quantities

HOSPHOROUS.—Antidote: Calcined magnesia, with di-

Phospiorous.—Antidote: Calcined magnesia, with diluents and demulcents given in quantity.

CANTHARDES.—Frequently given by ignorant men for
purposes, which are defeated, which produces dangerous
results causing inflammation of the urinary organs.

Symptoms: Violent thirst; copious discharge of bloody
mucus from the stomach, mixed with which may be seen
the shiny green particles of the flies. There is great pain
in the loins, swelling and inflammation of the genital
organs, pain in the bowels, and bloody stools and urine.

Antidotes: An emetic should at once be given, and the
dog should afterwards be deneched with demulcents
(such as oil), and a dose of opium given every three or
four hours.

four hours.

Corrosive sublimate is used for a variety of purposes Corrosive sublimate is used for a variety of purposes about farms. It is also used for destroying vermin. Symptoms: Violent vomiting and purging of stringy and offensive matter; the beliy distended and painful to the touch; the urine suppressed; cramp and twitches in the limbs, and frequently paralysis ensues. Autidotes: Tartar emetic, as an emetic; white of egg, followed immediately by infusion of galls; milk or gluten of wheat. Of the chemical antidotes, the albumen of eggs is by far the best; the white of one egg is sufficient to neutralize or render insolute four grains of solid bichloride of mercury.

Cambolic ACD.—This produces baneful effects even by absorbin through the pores of the skin, when too

Carbotic ACID.—This produces baneful effects even by absorption through the pores of the skin, when too freely used. It causes great prostration with trembling of the whole frame. Symptoms: Extraordinary depression of the vital powers; there is general shivering and almost constant trembling of the limbs, and a paisied notion of the head; bleeding at the nose is a frequent symptom, and the discharges from the bowels are also often stained with blood. The countenance of the sufferer is expressive of a most helpless and painful state. Parts Green.—The arsenite of copper; extensively used for destroying the "potato bug," Symptoms and unitials: Same as by arsenie poisoning. Corrosive sublimate, phosphorous and strychnine each enter into the composition of paste and powder largely

sold for the destruction of vermin, and it is when so used, being placed on bread and butter, bits of meat, etc., that they are most likely to be picked up by the dog.

Deaths by Paris Green.—West Boylston, Mass., July 20th.—Mr. Charles P. Smith's (Waltham, Mass.) orange and white setter Ned died on July 4th, and also Mr. Jerome Marble's (Worcester, Mass.) black and tan setter Nelson, (from the effective State of the Nelson, (trouse-St. Kuda, med on July Juth, from the effects of Paris green. Both dogs were poisoned at same time by running through a potato field where Paris green had been sprinkled on the vines to destroy the Colorado beetle. Mr. Marble's Nelson was a beauty, not a white hair on him, and the very picture of Grouse. Mr. Smith's Ned was a year old and a very promising field dog. J. P. B.

Horsehair for "Distemper."—In our issue of June 14th we published a communication recommending horselair as a sure cure for "distemper," our editorial comment at the time being that horselair cut fine would no doubt create local iritation and rid dogs, to some extent, of worms, but how it would cure "distemper" we utterly failed to see. This, has caught the eye of our friend Mr. Dalziel, who, in his usual happy way, alludes to it in an English contemporary as follows:—
"An American sage has discovered that horsehair is a cure for distemper in dogs. The hair must be taken from the tail of the horse, cut very fine, and a heaped-up teaspoonful given to the dog three times a day in his food nutil he is cured—the italics are mine.

"Distemper is a term used for want of a better, and is in itself an admission of our ignorance of the disease or distellar."

mutil he is cured—the italics are mine.

"Distemper is a term used for want of a better, and is in itself an admission of our ignorance of the disease or diseases it applied to. I say diseases; for with extended experience of distemper cases my conviction grows that under that name maladies distinct in character and in their symptoms are included. I am much disposed to think that faith in vaccination as a preventive of distemper is to be accepted as justified by results, if, as appears to me probable, dog-pox (which is similar to smallpox in man) is one of the diseases very often classed under the general term distemper. I by no means wish to dogmatize. I admit this to be presumptive only, and I offer the hypothesis to thoughtful and observant breeders with the suggestion that they might greatly benefit themselves and others by carefully noting the symptoms in cases occurring in their own kennels, giving them in sequence of time, with the treatment adopted, and submitting them for comparison. The kennel columns of all papers devoted to such subjects would be better filled with clear observation of symptoms, etc., of many cases, or an occasional digest of these, with inferences to be drawn from them, than such bald statements of cures with this, that, or the other, which like the case referred to at the comming of this letter are concerning as about to the inventor of the letter are concerning as about to the

observation of symptoms, etc., of many cases, or an occasional digest of these, with inferences to be drawn from them, than such bald statements of cures with this, that, or the other, which like the case referred to at the opening of this letter, are generally as absurd to the intelligent as they are misleading to the uninformed.

"Horsehair has long held a place, if not in the canine materia medica of the colleges, at least in that of kennel men. The hair from mane or tail is from its thickness most suitable; for if very flue it would have no effect, and if very strong, like pigs' bristles, or the label-wire-hair of Badger's Scotch terriers, it would penetrate the gut; indeed, there is always more or less danger of it at feast causing more intestinal tritation than is sought or needed for the expulsion of worms, for that is the purpose for which it is given. On that account I do not recommend it; but for those who wish to try it, the following will prove a suitable dose for a dog of fitty pounds or so: Cut the hair in lengths of about the 32d of an inch, and give half a drachm made into one or two balls, with a little limseed meal and lean meat well pounded together.

"Cut horse-hair belongs to the last of mechanical vermifuges, others being cowbage, iron filings, granulated tin, and tinely powdered glass. Youtat strongly recommends the latter; and against the popular belief in the danger attending its administration, he says: 'Not a particle of it penetrates through the mucous that lines the bowels, while it destroys every intestinal worm.'

"The dose for a pointer, greyhound, or dog of similar size, is a small teaspoonful, with about ten grains of ginger, mixed with suct or hard butter.

"Befor leaving the subject of worm medicines, let me point out how otten disappointment follows from the use of inferior drugs, or such as from age or other cause have lost their efficacy. Areca nut is one of the most useful vermifuges we have; but unless the nut is sound, it cannot be relied on. Last summer I had to pass a

not be relied on. Last summer I had to pass along one of the principal thoroughfares in the city of London several times a week, and, month after month, I saw exposed in a window a large heap of areca nuts, many—if not most of them—worm eaten. These were utterly useless as a vermifuge; yet it is generally these that are ground up and sold as areca nut powder. Let the dog owner beware; and if he wishes to use arneca nut for worms, let ware; and it is wisses to use alneed that he sees are not wormed at an and that weight the heaviest. It will be a sufficiently line powder to rub these down on a nature grater, although a further rub down in appropriate to be preferred, especially if intended for in a protrain is to be preferred, especially if intended for in a protrain is to be preferred, especially if intended for in a protrain is to be preferred, especially if intended for in a protrain is to be preferred, especially if intended for in a protrain is to be preferred, especially if intended for in a protrain in the contraint i

DEW CLAWS IN ST. BERNARDS.—La Belle Sauvage Yard, Ludgate Hill, E. C., London, Eng., July 19th.—Editor Forest and Stream:—I have just read Mr. Dalziel's letter to the Live Stock Journal in your columns, and as my name appears in it I should like to beg space in which to state how much I disagree with him on the subject of dew claws in St. Bernards. It is all very well for our good friend to talk airly about accidental monstrosities, and to quote letters from the author of the Descent of Man, but I only consider it a ruse to draw us away from the main point at issue. I have no hesitation in saying that 99 out of 100 St. Bernard breeders here and elsewhere like dew claws when they can get them, and m saying that 90 out of 100 st. Berhard breeders here and elsewhere like dew claws when they can get them, and it is when they get a good dogs without them that they profess to be indifferent on the matter. People might just as well say that the trace on the back of a pug, the lines up a black and tan terrier's feet, the shortness in face of a buildog, or the beautiful features of a setter were matters of no consequence, and I darseay Mr. Darrier accounted by the pure I fail to see win, or sombody else, would back them up. win, of sombody edse, would back them up. I am to see why, because Tell was blemished, other dogs similarly affected should be given prizes; and Tell, good dog as he was in his day, even if he had dew claws, could hardly win now against our modern champions. One thing I know is, that it will be very much against up inclinations.

tion if a St. Bernard without dew claws or a white-colored dog ever wins under yours fraternally, VERO SHAW.

VERO SHAW.

CARROLIZED PAPER FOR KENNELS.—Stranley, Morris County, N. J., July 19th.—Editor Forest and Stream:—Permit me to call the attention of your many readers, who own dogs, to the best and simplest appliance for relieving both dogs and their kennels from fleas. Capt. John F. Rodgers, U. S. A., discovered that carbolic acid (which is naturally a volatile body and very caustic when coming in contact with the skin) would unite readily with bitumen; also that cloth or paper saturated in this compound was not caustic, and the virtues of the carbolic acid would be perpetuated for several years. "Water Proofed Carbolized Paper" is now being manufactured, and is known to most of the dealers in sportsmen's goods in New York. It costs but ten cents per yard and is clean and healthful. Kennels lined with this paper will always be free from fleas. This paper also affords absolute protection from moths.

[GRO, SHEPARD PAGE.]

GEO. SHEPARD PAGE.

The use of this paper would not be injurious, unless the odor from it is too strong, and the kennel small.

WITHDRAWAL OF FAUST.—St. Louis Kennel Club, St. Louis, July 37th.—Editor Forest and Stream;—Please state in your paper that the St. Louis Kennel Club has withdrawn "Faust" from the public stud.

CHAS. H. TURNER, Sccretary,

#### KENNEL NOTES.

NAMES CLAIMED.—Rona—Mr. C. M. Ogden, of Washington, D. C., claims the name of Rona for Gordon setter bitch out of Mr. C. H. Raymond's imported Juno, by Dr. H. F. Aten's field-trial winner Glen.—Gen.—Mr. M. P. McKoon, of Franklin, N. Y., claims the name of Glen for a brown and white bare beagle hound bitch puppy, bred by Mr. N. Elmore, of Granby, Conn., out of his Victor and Lucy. Mr. McKoon obtained the bitch in exchange for a fine cocker blich puppy. Sue—Mr. N. Elmore, of Granby, Conn., dakins the name of Sue for his blue-mottled foxbound this accordance of the Mr. McKoon of Franklin N. Y. Conn., canns the name of such for his note-motion formation, blitch, presented to him by Mr. McCoon, of Franklin, N. Y. Sam Weller—Mr. William Stanley, of Englewood, N. J., claims the name of Sam Weller for his black and tan puppy, out of champion Belle, by Toledo Kennel Club's champton Grouse.

SALES,—Victor-Venus, whelp-Mr. N. Elmore, of Granby, Conn., has sold to Mr. Thos. Blyth, of Melityre, Pa., a fine English hare beagle puppy, by Victor out of Venus. Mr. Elmore writes that the sale was made through his advertisement in our last issue.

WHELPS .- Nellie-Mr. Chas. F. Mann's (Worcester, Mass.) black Mass., whelped July 29th twelve pupples, seven dogs and five bitch. R. A. Taft's, of Dedbam, Mass., whelped July 29th twelve pupples, seven dogs and five bitches, by Mr. F. A. Taft's Jerry.

PRESENTATION.—Elmira, N. Y., July 30th.—I have been pro-ented by Mr. N. Elmore, Granby, Conn., with a fine beagle puppy by Victor out of Lucy. Please acknowledge through your kennel notes and oblige. E. H. WALKER

#### COL. BODINE AT HOME.

THE Inman steamer City of Chester arrived in port on Sunday evening last, and after a night spent at Quarantine anchorage, Col. Bodine and Messrs. Clark, Rathbone and Fisher, of the late American team in Iridand, reached the city. There was no demonstration on their arrival, and the four gentlemen were soon hurrying off to their families. They were all in oxcellent health, and spoke of their trip as a most enjoyable one from start to

finish.

Col. Bodine, in conversation with our representative, speaking of the work in Ireland said: "The day after we reached Dublin the men began to get ready for the march. I suppose our scores looked rather low, but we were not shooting as a team or for record. Many of the men had new likes and the ammunition had all to be tested and tried to get its best effect. There were no flags on the range to show the direction of the wind, for the Irish Ride. the range to show the direction of the wind, for the Irish Itife Association had but Just taken possession of the spot. On the Fiday before the Tuesday on which the match was shot, isolected my six men out of the nine, and on that Saturday we had a regular shoot with the men squadded as for a match. The Irishmen had been very confident of winning, and the feeling over there was that we were to be whipped. They Judged merely by the scores which we were making. When we rolled up that Saturday score the opinion changed. I never had any doubts of the result. On the day of the match my men worked magnificently. Mr. Donaldson, the Secretary of the National Rufe Association here, kindly went down to the hutts to see that the marking was all right. On one target were Clark, Scott and Fisher shooting here, singly won't down to rise full to see that the manage was all right. On one target were Clark, Scott and Fisher shooting in order, with Laird as spotter at the target, while on the other target Rathbone, Parrow and Brown were the shooters, while I sat at the glass and watched the shots.

"We did not shoot our match as it is usually done, each man

following his leader at his own leisure. In place of that we shot in following his reaction at his own results. In place of that we shot in sections. The plan was to send in our shots as quietly as possi-ble; that is, each three men would load and then as fast as one shot, the next would drop down and deliver his fire, taking, of course, ample time to aim. We fired each particular shot as though it was the deciding shot of the match, and I never saw though it was the deciding snot of the match, and it here's saw finer discipline. We had no utaccountable misses, and none of the men kicked over the traces. Clark and Rathbone were good leaders, and there are no two botter tidemen for judgment in the world. The light was good, but the wind was fluctuating from 5 to 7 o'clock on the dial, what we would call at Creedmon at bot rem fight-tall. The wind gauges were changed between every shot, and often would be moved from a point or two for a left wind to a

often would be moved from a point or woo for a feet wind to a point or more for a right wind. It was a wind that needed to end of watching, and we were all keenly keeping track of it.

"In my difficial veport I think I will give lithographed copies of Clark's record book, made on the range, so that it will enable elflemen to understand precisely the difficult conditions under

which the match was shot.

"We received the best of treatment during the match, but toward the end of the match there was a rush of smoke across the

range from the furze bushes which had been set on fire. This stopped all firing for a time. My impression is that the stuff had been fired by some one who wanted the Irish to win, and thought been fred by some one who water the first by what and thought that the haze of a smoky atmosphere would favor them and baffle us. The smoke was too heavy, however, and all wete compelled to suspend for a while.

"When we shot on Saturday before the match and got an aver-

of 211, I thought that would win and did not look for the big

of 211. I thought that would win and did not look for the big record of the match.

"The New Righty is very like our new Hepburn rifle, but heavier in the breceh mechanism. They have adopted our slow-burning powder in place of their quick Curtis & Harvey. They have taken our eartidges and our rifle in all essential points. They can do the very best of work with them, and we have got to work very hard if we expect to hold our own any more.

"The Irishmen took their defeat courteously, and said they would get a team over here next year, either to compete for the Palma, which they have not given up, or for this same match

again.

"Thenr there has been much ill feeling about Jackson belog put on the reserve, but Jackson was left off on his record. He had not been shooting well before he left, and he did not shoot steadily after we reached Ireland. He was left out on that are count only.

When the Hyde flasco was mentioned Col. Bodine said: "I want When the Hyde flasco was mentioned Col. Bodine said: "I want to say as little as possible recarding that unfortunate Wimbledon affair. The matter is already protty well understood by the public. I endeavored by all the means in my power to prevent the match coming off, and told the refractory members of my team that I should leave before it would come off, together with those of my original six who might be ready to sail with me. I did not want to indorse the match even by my presence in England. However, Parrow and Jackson would not itset to my sailvice, and finally left me, after which I had nothing further to do

with them.
"I very much regret the Hyde affair. I did not hold any com-"I very much regret the Hyde affair. I did not hold any com-numication with him while I was away, and carried out what I considered to be the feeling of the American National Rifle As-sociation roward him and his march. I am gial I was present to let the Englishmen know just what was thought of Hyde and his doings on this side of the water. He and Haltord seemed to have an infatuation in pushing on that match. They had induced the N. R. A. of Great Britain to show it special honors by putting it on their programme as an 'international match.' I wrote to Earl Stanhope, who succeeded Lord Eloho as President of the British N. R. A., and regived a very courteness reply. In which Earl Stanhope, who succeeded Lord Leads as President of the British N. R. A., and received a very courteous reply, in which whatever of recognition the match had received from the British N. R. A. was taken from it. I was anxious to avoid the breach which would have taken place between the two associations if which would have taken place between the two associations if one had persisted in leading its countenance to a match which the other had repudiated. I think now it is pretty well understood that it was nothing more than ascrub faffar, and while the English team shot in fine shape the Hyde team were in no shape to meet them and invited the defeat which they surfered. I had left Wimbledon and was on my way back when this scratch match was fought, as I did not wish to give it even the countenance of my presence. I am very sorry that is should have happened, and think that the English ridemen and the association will be more careful in future about associating with irresponsible marksmen who wish to get up matches to any purpose: "

oi. Bodine had a bit of a trouble at the Custom House, and Col. Clark's rile was seized through some misunderstanding with the customs officers.

#### RANGE AND GALLERY.

Boston, July 28th .- A fair number of riflemen appeared at Wal-Hostins, Jan 2011. The most of the transport of the marksmen. Mr. Halbeth was very unfortunate at the last distance. The day was a good one for the marksmen. Mr. Rabbeth was very unfortunate at the last distance. His miss was a bullseyo on the wrong targot, causing him to lose first place. The score stood :-

Yesterday the Medford Amateur Rifle Association opened a A ssterday time Mediorn Amateur Rule Association opened a new match, designated as the "Gold-badge series match, No. 1." This inatch will be shot on a Creedmoor target. The first prize will be a gold medal and the second prize a sliver medal; also cash prizes in first and second classes. The regular matches in the Medford count targets will be continued as usual on the same day.

BOSTON, Mass., July 31st .- The attendance to-day at Walnut

Hoston, Mass., July 31st.—The attendance to-day at Walnut IIIII was not large. The wind came from the west, gentle, indicating 9 o'clock, and never changed a point during the entire day. In the early stages of the shooting a slight haze prevailed, which produced a most perfect light. The little 4-inch bull on the Mass, target looked prominent, and was easily found by Mr. O. M. Jewell, who made the score of 210 out of a possible 220, followed closely by Mr. Richardson, who was recorded 200, and Mr. Charles, with his military rile, made 203.

In the trial on the Creedmoor target a large number of entries were made. Mr. C. C. Wemyss, a member of the Roxbury City Ghards, took the first place with a military rile, making a good 45 with no handicap added; Mr. R. Davis came next with 45, being outranked by the former, and Mr. Richards was recorded with 45. The 500 yard match did not fill, and only a few entries were made in the amateur match. The best score made was by Mr. Richards, who made an elegant score of 47, which places him among the leaders jn the struggle for the gold medal which is

oveted by all the marksmen. The following scores are the best made in all the contests:—

Wakefield, Mass., July 31st .- The attendance to-day at Wake-WAREFELD, Justs, July 318:—The attendance to-day at wake-field range was not large, although the rillemen present made many refutries. The wind gave no trouble, and the day proved a perfect one for the contest. The Mediord target was used, Mr. Howard leading all the contestants with 51 out of the possible 60. Chandler and Rodgers following with 53 cach. The summary shows how well the gentlemen held on to the 8-inch bullseys

MAMMOTH RIFLE GALLERY .- Boston, Aug. 2d .- The Any Rifle MAMOTH RIFLE GALLERY.—Boston, Aug. 22.—The Any Rille Match closed last Saturday night, and throughout the month good shooting has been shown, but it remained for Mr. E. F. Richardson, of the Massachusetts Rifle Association, to lead all others in this respect. On the evening of the 31st, after the Walnut Hill meeting of that day, he visited the gallery and made the 5 best consecutive scores ever made in the gallery; three 38s and a nest consecutive scores ever made in the gallery; three 3% and two 3%, or 120 out of a possible 2%, is a great accomplishment and worthy of especial mention. Mr. Frank Hollis, of the Medford Ride Association, wins the second prize with 187 out of a possible 200. The following are the prize winners with their scores in detail; 50 yards; rounds 8; possible 40; 5 scores to win, or pos-

ARCHERY IN THE LITCHFIELD HILLS .- On Monday, July 26th . ARCHERY IN THE LITCHETED HILLS—On Monday, July 26t1, "an interesting match took place at the Reers House, Cornwall, Litchfield, Conn., between rival teams, E. I. Horsman, of the Brooklyn Archery Club, acting as Captain of the Blues, and Judge Rufus B. Cowing, of New York, acting as Captain of the Reds." The return match took place Monday, Aug. 2d, as previously announced. Mrs. Col. Jos. G. Story, of Brooklyn, presented the archers with elegant slik badges: blue for one team and red for the other. Judge Cowing baving been summoned to New York, Mr. L. S. Hallock, of Orange, N. J., acted as Captain for the reds. The fitchfield stage brought numerous spectators. The shooting was highly exciting and spirited throughout, and the match was closely contested, as the following score will show. Blues, E. I. Horsman, Captain:—

—Mr. L. L. Peddingbaus, of Marietta, Obio, who won the championship at the second grand annual tournament of the National
Archery Association, held at Buffalo last mouth, has decided to
make his home at the East. He has associated himself in business with Mr. E. I. Horsman, of Now York, and at the monthly
meeting of the Brooklyn Archery Club, held at Prospect Park
Hotel on Saturday evening, July 31st, Mr. Peddinghaus was
proposed and duly elected a member of the Brooklyn Archery
Club. It is to be hoped that with so fine an archer as Mr. Peddinghaus in our midst, that the interest in archery will be
greatly increased at the East, and, at the next grand annual
tournament, to be held at Prospect Park in 1881, may the scores
of our Eastern Archers compare favorably with the toxopolities. of our Eastern Archers compare favorably with the toyonholites of the West.

-The Oakland Bow Club, of California (F. C. Haren's club), have challenged the Crescent Bowmen, and they will shoot (by telegraph) the American Round on Aug. 11th. 1880.

#### FIXTURES.

August 6th-At Haledon, Paterson vs. New York, August 11th-At Hoboken, St. George vs. Manhattan.

A match between the Gentlemen of America and resident —A limited between the Gentlemen of America and resident professionals has been arranged to take place in Philadelphila early in the autumn. The inauguration of this fixture promises to be one of the most interesting events in the history of American etcket. The professional team will be represented by the following players: George Wright, Lane, Tyres, Brooks, Norley Smith, Brewster, Glies, Bromhead, Mart and Oldham.

-The Longwood Cricket Club, of Boston, has decided to make a week's cricketing tour through Canada next week. The cleven will leave Boston on Saturday, and play at Montreal, Port Hope, Toronto and Hamilton. The team is as follows: Messra Dutton, Farley, Fay, Bixby, Kimball, Hubbard, I ickering, Mixer, Caton, Tyler and Peabody. Mr. Haughton, of the Staten Island Cricket Club, will act as umpire.

-Canterbury week began on Monday last.

-T. A. Fison scored 254 (retired) for Hendon vs. Highgate, Aug. 2d. 1879.

-Mr. J. B. Thayer, of Philadelphia, is spending the summer in Colorado.

-Secretaries of cricket clubs newly organized will please sema their addresses to this paper.

THE LAWS OF CRICKET IN THE PAST AND PRESENT.

WE take pleasure in presenting to our readers an illustration showing how the game of cricket was played a century ago. This quaint picture is taken from a little paper-bound book of the Laws of Cricket, brought to this country in 1775 by Benjamin Franklin, now in the possession of the Young America Defining Franking flow in the possession of the Foung after Creicket Club, of Philadelphia. Through the kindness of M Daniel S. Newball, we are enabled to reproduce the fac-simile, the original appears in the frontispiece. Unfortunately the hittery of this valuable little book is not as clear as we would wish tory of this valuable little book is not as clear as would wish. It was presented to the Young America C. C., June 4th, 1867, by Miss Mary D. Pox, of Philadelphia, who gave, through a third party, something of its history, but not definite enough for publication. That Franklin was an admire of outdoor sports there can be no question, for in several letters of his written while in London, the originals of which are now in the possession of the editor of this column, he mentions having been a looker-on, while a series of matches of cricket were being played, but whether he himself added the accomplishments of howling "grubhers" and "taking a few," to that of kite-flying he omits to state. It may not be generally known that two of the sayings of Poor Richard, most often quoted, were forced from the lips of the philosopher upon witnessing the two days' match, namby; "Never leave that till to-morrow which you can do to-day," and "Dost thou love life, then do not squander time, for that is the stuff life is made of." stuff life is made of."

To enable those of our readers who are interested in the records of cricket to make a comparison between the laws of the game of a hundred years ago, and those supposed to govern the rulings of to-day, we reproduce below the contents of the little book. This will show with what obstinacy the Marylebone Club

The Party which Goes from Home shall have the choice of the innings and the pitching of the wickets, which shall be pitched within thirty yards of a center fixed by the adversaries.

When the parties meet at a third place, the bowlers shall toss

up for the pitching of the first wicket, and the choice of going in.

The Bowler.

Must deliver the ball with one foot behind the bowling crease, and within the return crease; and shall bowl four balls before he change wickets, which he shall do but once in the same in-

He may order the player at his wicket to stand on which side

The Striker Is Out, If the buil is bowled off, or the stump bowled out of the ground. Or, if the buil, from a stroke over or under his bat or upon his hands (but not wrists, is held before it touches the ground though it be hugged to the body of the catcher.

though it be lugged to the body of the catcher.

Or, If in striking both his feet are over the popping-crease, and his wicket is put down, except his bat is grounded within it.

Or, if he runs out of his ground to hinder a catch.

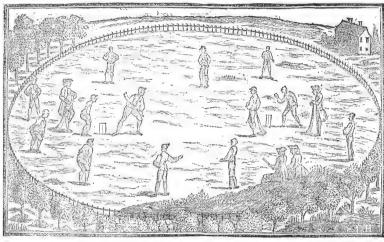

Or, If in running a notch the wicket is struck down by a throw, or with the ball its hand, before his foot, hand or bat is grounded over the popping-crease, but if the ball is off, a stump must be

over the popping-crease, but it the ball is out, a stump must be struck out of the ground by the ball.

Or, if the striker touches or takes up the ball before it has been still, unless at the request of the opposite party.

Or, if the striker puts his leg before the wicket with a design to stop the ball, and actually prevents the ball from hitting his wicket by it.

It the players have crossed each other, be that runs for the wicket that is put down is out; if they are not crossed, he that has left the wicket that is put down is out.

have held to the traditions of the past, and how, from year have held to the traditions of the past, and how, from year to year, rules have been added to this mass of incomprehensible patchwork. No beginner, outside of a lunatic asylum, would take a copy of the laws of cricket, as revised by the Mary-lebone C. C., in 1870, as a guide to play the game. As we have said before, excepting the accounts of the "Adventures of Alice in Wonderland" and the "Hutting of the Snark," the equal of the Marylebone laws for descriptive clearness have never been published. "Fancy a party of beginners," says a writer on this subject, "who had never seen the game played, attempting to learn the laws without other onlightenment. For example, they would never run 'byes' or 'leg-byes,' for the former are not mentioned[in the laws, and the only proment. For example, they would never run 'byes' or 'leg-byes,' for the former are not mentionedfin the laws, and the only provision regarding the latter '(viz., in Rule XIII—If the ball shall first touch any part of the striker's dross or person, except his hands, the umpire shall call 'leg-bye') 'does not suggest running as an essential.' The fact is, that the Marylebone Clubshould put the laws of the game in such a shape that the lovers of cricket can introduce them intelligently in a strange land. They are too primitive, mysterious and incomplete at present. Not a week passes but we are petitioned by some far-away club to send them a set of rules for playing the game, that "they cannot make clear to some of the members that the umpire has got anything to do with the decisions, and that some of the laws seem to bear a double interpretation; and although a few may be determined easily off-hund by the least crudite of umpires, there are others which puzzle the most astute."

TBL LAWS OF CHECKET.

THE LAWS OF CRICKET.

The Ball.

Must weigh not less than five ounces and a half, nor more than five ounces and three quarters.

It cannot be changed during the game, but with the consent of

both parties.

 ${\it The Bat.}$  Must not exceed four inches and one-quarter in the widest

art. The Stumps.
Must be twenty-two inches; the ball six inches long.

The Bowling Crease

Must be parallel with the stumps, three feet in length, with a

The Popping Crease.

Must be three feet ten inches from the wickets, and the wickts must be opposite to each other at the distance of twenty-

\*By a subsequent appointment, it is settled for to use three stumps instead of two to each wicket, the bail the same length as above,

When the ball has been in the bowler's or wicket-keeper's hands the strikers need not keep within their ground till the umpire has called play; but if the player goes out of his ground with an intent to run before the ball is delivered, the bowler may put him

When the ball is struck up in the running ground between the wickets it is lawful for the strikers to hinder its being catched, but they must not neither strike at nor touch the ball with their If the ball is struck up the striker may guard his wicket either

If the ball is struck up the strucer may guard his whose clause with his bat or his bodly.

In single wicket matches, if the striker moves out of the ground to strike at the ball he shall be allowed no notch for such stroke.

The Wicket Keeper.

Shall stand at a reasonable distance behind the wicket, and

shall not move till the ball is out of the bowler's hand, and shall not by any noise incommode the striker, and if his hands, knees, foot or head be over or before the wicket, though the ball hit it, it shall not be out.

It shall not be out. The Umpires.

Shall allow two minutes for each man to come in and fitteen minutes between each innings; when the umpire shall call play, the party refusing to play shall lose the match.

They are the sole judges of fair and unfair play, and all disputes

Shall be determined by them.
When a striker is hurt they are to allow another to come in, and the person hurt shall have his hands in any part of that innings.
They are not to order a player out unless appealed to by the ad-

But if the hower's foot is not behind the bowling-crease, and within the return crease, when he delivers the ball, the umpire, unasked, must call no ball.

If the strikers run a short notch, the umpire must call no

Notch.

Bets.

If the notches of one player are laid against another, the bet depends on both innings, unless otherwise specified.

If one party beats the other in one innings, the notches in the first innings shall determine the bet.

But if the other party goes in a second time, then the bet must be determined by the numbers on the score.

No man allowed to leave a yacht during the race. Beoming out or taking in ballast will not be allowed.

however, the year to country of so without couning in country or bouy, the yacht nearest ther most boar, and should any other race compel a yacht nearer any said mark, boat or buoy, the yacht of the year to the prize.

#### MEASUREMENT.

Editor Forest and Stream :-

Editor Forest and Stream:—

Lobserve from your writings in Fornest and Strugar that you are a decided opponent of measurement by length; and, as you seem to attribute all the bad qualities of your "sloop" type to the effects of that system, this is not to be wondered at. I quite agree with you in your characterization of American and English yacits. The latter have certainly run fals a groove quite pecupacity of the properties of the system and the properties of the properties of the system and the stream of the structure of the control price of the system and the structure of the course, quite pecupacity of the seem insight by that experience that a "found work well. But perhaps it may still be permitted to doubt whether we are justified, on this evidence, in condenning attack, length as the basis of classification, and whether it would make the properties of the seem to be succeeded by the second properties of the classification, and whether it would not be succeeded by the second properties of the classification, and whether it would not be structured to the use of the center-board. The center-board is a mechanical contrivinger, which, in smooth water, places a shiftow, flat-bottomed vessel on an equal-interest properties of the second properties of the would be strunge, indeed, if builders did not take advantage of it and build shallow boats.

board. The center-board is a mechanical contrivance, which in smooth water, piaces a similow, hat-bottomed vessel on an equality with a deep one for working to winchard; and traves her far would be strange, indeed, if builders did not take advantage of it and build shallow boats.

2. No restronge, indeed, if builders did not take advantage of it and build shallow boats.

2. No restruction as to number of crew, und, consequently, to stead of carrivas. You say your slope repulses almost twice the work them to advantage. With a moderate crew, would not a moderate sail streat be a necessary consequence? And would not excessive beam disappear when enormous initial stitutess could not make a subject of the state of the control of the con

by messuring ber 3 dimensions, I should be disjoised to doubt that the Nova Scona V. S. rule would give satisfactory results in the long run. The long run that includes most rules in tase, tend to produce long vessuls that includes most rules in tase, tend to produce long vessuls is an exception specially of seagong purposes. The Ihames rule is an exception simply because t does not do what it was intended to do—it does not afford a measure of power.

As already stated, I am ready to concelle, on the strongth of As already stated, is run ready to concelle, on the strongth of coxcessive still rules, which is common to almost int rules; but it is by no means clear to my mind that length should not be the basis of classification for spood. It is possible attough I cannot be taken into account, but assuming the run same shape should be taken into account, but assuming the run same shape should be taken into account, but assuming the run same shape should be taken into account, but assuming the run same shape should be taken into account, but assuming the run same shape should be taken into account, but assuming the run same shape should be called as the product of the long of the

Lauren, Norwey, July 4th.

It altoris us great bleasure to publish the matured thou, offs of mon by their qualifications fully able to deal intelligently with the question they discuss, whether they agree with us or not. Mr. Colin Archer's letter will be read with attention by all on this side of the Atlantic, as his name is as well known on this continent as it abroad for his valuable contributions to modern naval science. Incidentally we may also puth to such examenations are eidence of the universal circulation of Foress and Streem and the center of the contribution of the con

we will not take advantage of the fact and enter upon an area-

we will not take advantage of the fact and enter upon an argument doub outraine, but indicate the line of thought by while we arrive at our conclusions.

Two things by way of premise, however. We cannot blame Mr. Archer for making us at our word and identifying "power" with "stability." We used the word "power" as it is generally understool, among yachtsmen here, as synonymous with "momenstool, among yachtsmen here, as synonymous with "momenstool. stood among yacusuna nere, as yanun mons with tum," though in technical parlameet there is no connect tion between the two, "power" among naval architects meanin "stability," something altogether different from "momentum, Liko Mr. Archer, we are very far from counselling "stability" a a basis of measurement. It is so clearly the outcome of model, and therefore something that should not be taxed, that we have and therefore something that should not be taxed, that we have allways set our foot upon anything like measurement by sail area, by area of water line, or the Thames rule, all of which are indices of a vessel's stability. We believe Mr. Kemp once published a table of sail areas showing how nearly the Thames rule measure storie of sati areas snowing now nearly the I names rue measures stability, hence to be abnormal tendency among the modern cut-ters to decrease their stability, and consequently their measure-ment, in proportion to size, by deflucting from beam and adding more rapidly to unfaced size and momentum than to stability forcrease of length. We delive with Mr. Archect that the modern cutter, though possessing underiably good qualities in the most cutter, unuga possessing undernany good quanties in the most important directions, is not the best type of vessel for the money invested, except when salling under the rule of measurement which has favored their production so strongly, and that under a more equitable rule more moderate forms would come to the fore, especially where speed is expected. In the three example order, especially where speed is expected. In the funce examples given and in the following phrase Mr. Archer strikes the key note of the weakness of measurement by three dimensions pure and simple: "The influence of length, breadth and depth in enabling a vessel to get over the ground is very different not only in de gree, but in kind, and any formula in which the three dimensions gree, but in kind, and any formula in which the three dimensions have the same innetion necessarily offers a direct encouragement to extend that dimension which is of most value for increasing the potentiality of speed." This is meontrovertible and this danger we had foreseen all along. To obviate the desired to have the three dimension rule so modified as to make it virtually the Thames rule minus the had features. We proposed the adoption of "standard depths" for measurement purposes, such depths to depend upon a consideration of the other two clifed dimensions. Such a step would at once remove the tendency to build shallow vessels on one hand, and on the other would debuild shallow vessels on one hand, and on the other would deprive the designer of any incentive to extravagantly narro prive the designer of any incentive to extravagantly narrow craft, as the Y, R. A. or Thames rule now does by making what we ma, fairly call its "standard depth" dependent upon only one of the remaining two, thereby checking on one and street-ing the other. But knowing the difficulty of moving great bodies, especially when disorganized, as the American yachting public still is, we deemed it advisable for the time to drop pressnumer starts, we deemed a navisator for the time to cop press-ing the point for fear of wrecking the whole scheme at the out-set by complications which the general public is never fond of On the principle that half a loaf is better than none at all, we hoped that after the three dimension rule had once become gen-Anopea that after in three uniesson fur an once become generally adopted, it would have been an easy matter to induce the final step of substituting standard depth and avoid the construction of types which other no inducement to other phases of the sport than racing. Confect que to premier pasqui coute.

However, these are side issues. We will attempt to lay our course of reasoning in the matter before the reader in concise

We take it for granted at the outset that races are sailed as a test of model, and that the object of granting time is to allow a fair test between yachts differing in some initial advantage due to tural causes and which are not the result of artifice or form natural causes, and which are not the result of artines or form. Eliminating extraneous, irrelevant disturbances, let us consider a series of races between two yachts, A and B, in all their variations. A and B are supposed to be built on exactly the same lines, but A the larger of the two. In a fair race A will outsail B. The dis ce between them at the finish represents the value of the diftance between them at the finish represents the value of the dif-ference in six between A and B, and is the amount which A should allow B in order to bring about an equitable test of their models. Heing exactly alike, they should at the end of our "theo-retical race" be piaced even at the finish, and this the time al-fowed B should exactly accompish. The distance which A has outsailed B is not due to the difference of length in her favor, for beam and depth have been increased in the same ratio and the canvas as well. In other words, while the resistance may have been doubled, the propelling power has only been increased in canvas as well. In other works, while the resistance may have been doubled, the propelling power has only been increased in exactly the same ratio, and were it not for some wirthe intredy independent of linear dimensions, per se, the yacht A would clearly sail no faster than her smaller sistor B. Why, then, has A beaten

This is the answer. Upon the assumption that  $\Lambda$  is twice as This is the answer. Upon the assumption that A is twice as long, twice as wide and twice as deep as B, she will experience four times the resistance of B, but her size, diplacement, and therefore momentum, will be cight times that of B. It is in this factor increase in size and momentum in proportion to resistance, that we have the reason of A's outsailing B, and in this only. Hence a theoretically correct table of time allowance should be constructed upon the value found in practice to attach to various constructed upon that the control of the definition of the differences of momentum. The fact of A's length being greater than that of B is purely incidental, and to it alone none of the excess of speed over B is to be ascribed. Building time tables upon length is confounding cause and effect.

Further, that length is a deceptive criterion, will appear from the following: Instead of A being built on the lines of B, assume her to be shorter, but yet of greater size—a very likely assump-tion. A length measurement would saddle B with a penalty, whereas from the foregoing it appears that the natural advantages whereas from the foregoing it appears that the natural advantages flowing from greater size are in possession of A, and the latter is the subject for a just tax. Let them sail a race as a test of model. Again set us uppose A whos. The amount by which she has won is certainly not an exhibit of the superiority of her shape, pure and simple, for she has been aided to a certain degree by the momentum due to her excess of size over B. To justly weigh the worth of their models, then, an allowance must be made by A to write the first models, the latter is the superiority of the model. A first all the subject is the superiority of the model. d B. will represent the superiority of the model A.

sailed B, will represent the superiority of the model A. Should nothing remain after the subtraction has been performed, it indicates that the speed of A and B is exactly ailke, If "less than nothing" remains: in other words, if the subtraction cannot be performed, it proves that after eliminating the natural advantage of superior size, and bringing the two down to conclude that, research. nating any ange of superior sactions of the subtraction one level in that respect, A is not only not faster than B, but slower by just the amount by which the subtraction cannot be performed, or what in algebra would be known as a minus quan-

ty.
In each of the previous cases, allowances on length would have brought about exactly the wrong conclusion, and would have handed the prize to the wrong vessel, that is to the slower model, or at least modified the verifiet so much as to rob it of its value to naval architects. This is exactly what we see in America every day, where inferior models win prizes time and again ow-

ing to time allowance on length working just the wrong way making a vessel of moderate form pay to one of greater tounage but of less length, yet inferior in all other desirable attributes of a good vessel.

One thing more. We may have used the terms size and momentim as inter-convertible. Above Mr. Archer points out the difference between the two, where he instances the rubber ball and bullet. We have, in advocating a "three dimension rule," taken no notice of this difference, because a given size of vessel will enable the designer to settle upon a given displacement to produce one the designer to extent he prefers, large or small, and the re-sult he is prefers, large or small, and the re-sult he is not have to abide to small, it is not engine size the dis-tension of design in-tensionally executed upon the problem as an whole. Size of the tortiginal standard from which he works and which places is the big grasp a certain possible speed. What he manuges to produce from that size is model, and must sail on its own merits, varying

n that size is model, and must san on its own merits, varying discoments included. order to meet the chief objection sgainst bulk measurement to by those who in their baste condemn the seeming incongruity of taxing it when perhaps actually retarding speed by faulty location, we offer the following for consideration. Butk is taxed for its quantity in the rule, and not at all for its position. The objection urged does not hold good therefor. Its position always remains optional with the builder. If he puts it where it may actually be hurtful to speed, it is a matter of model, and if may actually be nutrul to speed, it list matter of model, and it the boat is beaten she is beaten owing to her poor model, which is no reason at all why in equity the builder should be exempt from paying for the greater momentum he has had the use of over the whole course, and which, as explained above, is at all times the necessary accompaniment of an excess of bulk, frespective altogether of its location in the model. To make this still plainer. gether of its location in the model. To make this still plainer, let us apply it to an example. If A is larger and of poorer model than B, the latter may outsail A. To obtain a truthful estimate of the worth of their models for speed, it is certainly elear that we must in equity eliminate the excess of mouentum which A possesses, due to her excess of bulk. Only when this has been done, when A has been shorn of such natural advantage, will the cone, when A has been short of such latural advantage, will the models have been placed on an equal basis, and the actual super-tiority in shape of B laid bare. To effect this in practice, an al-lowance of time deduced from practical observation must be given by A to B. The sum total of this allowance, added to the recorded victory of B, will represent the true gauge of B's supe recorded victory of b, will represent the true gauge of a super-tiority of shape or model, which was the aim of the vace in the first place. This is the rock that most split on, but we trust that after a thorough digestion of the foregoing it will be clear why a vessel should pay for excess of bulk, no matter where found, and why such payment is in no wise taxing model, but simply the attainable momentum, the only natural advantage which is innt to and varies with size, independent entirely of what fo

A bulk measurement is the only one devised which is correct in theory, and which leaves the modeller absolutely unfettered in choice of such shapes as will be most conducive to the aims be enouse of such snapses as with the most conductive to the same he has in view. When it is deemed desirable to so frame the rule as to encourage a particular kind of model, it can be submitted to limitations as required, with less departure from equity and logic than any other; and with no liability to produce what is not wanted or what was not expected.

Tax size and you reach the bottom, beyond which no one can tax size and you reach the bottom, beyond which no one can obtain any natural inherent advantage not accounted and paid for at the start in the shape of time allowance. In practice you may then modify the rule to the extent neces-

sary to produce the most serviceable type of yacht.

OCEAN PASSAGES.—From our excellent French contemporary, & Yachl, we clip the following concerning the occun passages underly American yachts:—1851, America, schoolner, 170 tons, New York to Havre, 21 days. 20078. Visi

Charter Oak, sloop, 23 tons, New York to Liverpool. Christopher Columbus, sloop, 45 tons, New York to Cowes,

PLUVIER, Boston, Mass.—How would you loud a medium choke 10 gauge gun, giving size of shot, for fall plover, at sixty yards? How for coot? Ans. It is impossible to answer such a question as yours. Give the weight of gun. For plover use 8 shot; for conts, 3 or 4.

W.S.S., Pottsville, Pa.—Your setter is out of condition. A mild course of sulphur, followed by \$xrs. of quinine three times a day for a week, may do good. Write result. We make no charge for treatment of dogs through this column, and are pleased when we can be of service to our friends.

A. M. R., Clearfield, Pa.-1. To what point of the compass is it best to face a target for aftermon shooting? 2. What substance is used at Creedmoor for painting the targets and marking off the builtet marks? Ans. I. Have the sun behind the backs of the shooters. 2. Whiting for white; lamb-black for black. Water or

J. H. E., Northumberland, Pa.—My setter bitch has been slock, Her bladder must be affected, as the water drops from her. Her nose keeps bot and her tongue is an unnatural color. Please ad-vise me what to do for her. Ans. Open her bowels freely with castor oil, and give her ten drops of tincture of fron in a little water three times a day.

E. G., Albany, N. Y .- Nothing as yet has been definitely arranged about sending an American cricketing team to England nextyear. But the matter is being seriously considered by the best exponents of the game, and we sincerely trust the venture will be carried out while the Newhalls and men of their class are in their prime.

W. S. H., Lewisberry, Pa.-Can you tell me what to bait v W. S. H., Lewisberry, Pa.—Can you tell me what to bait with to eath fall this, and how to fish for them? Also, how to "skitter" with frog, minnow or pork bait? What is the latter? Ads. For "fall fish" bait with worm or piece of fish, use float and fish at middle depit; they take fly at all times. To skitter well, the line should be but a trifle longer than the rod, the lait is east and by a movement of the rod sideways it is made to skip or "skitter" like a fish trying to escape on the surface. A pork bait is simply a piece of salt pork

W. A. K., Fort Hamilton .- My red Irish setter puppy, seven W. A. R., Fort Hamilton—My red trish setter puppy, seven months, has a continuous jerking and twitehing of the muscles and joints. Her bind quarters are so weak from this that they frequently give way under her. She is otherwise well, lively and has a good appetite. The nervous, jerking movements followed what I supposed to be a severe attack of distemper. Ans. The chorea of distemper is very difficult to cure. Quinine and nux romica seem to be the two best remedies. Two grains of the former and one-eighth to one-quarter of a grain of the latter tbree times a day.

W., Unionville, Conn.-Will you inform me wher e to find in W., Unionville, Conn.—Will you inform me where eto End information regarding the carp, what waters they thrive in, and where the young lish can be procured? Ans. The reports of the United States Pish Commission give the nost complete information on the carp. They thrive in warm ponds, frog ponds, etc., where there are few other good lish. They are vogetariaus to a great extent. You can get young ones from Prof. S. F. Baird, Cnited States Pish Commissioner, Washington, D. C. It would be best to make application to him through your member of Con-

P. C., Rhinebeck, N. Y .- I have a foxhound, which I found on P. C., Rhinebeck, N. Y.—I have a foxhound, which I found on my arrival home the other day to be very badly off. The trouble seems to be confined to the head, which, as far us appearances go, looks all sound, no swelling or eruption of may kind, but there is a discharge from one nostril, which is quite offensive. He also seems to have some difficulty in breathing, and his appetter is gone. Can you tell me what to do? Ans. The dog has, very probably, what used to be called head distemper, and which is not the epizontic form of the disease. Let him inhale the smoke of burning tar, and give him five grains of quinine myth and morning for four or five days. Open his bowels with castor oil and keep him quiet; diet liels and nutritious. keen him quiet: diet light and nutritious.

W H N Nor-ark - In a rite match with rules of N R. Associavern, A. B and C compete for prizes at 800, 900, and A used a breech-louder, B and C muzzle-loading rilles-1,000 yards. During the 1,000 yard stage, A had a " miss-fire," by reason of lecting to put any powder in his shell, exploding cap only. B folnext, and after firing, found he had neglected to put a bullowed next, and after firing, found he had neglected to put a bul-let in his gun. A and B each chaim another shot, while C claims each should be scored a miss. A also claims B is not entitled to another shot on ground that the gun "went off." Which is right? Ans. C is right. A and B both are entirely wrong. A rille going off at firing point counters as shot; if it go off not at firing-point, the careless fellow should be barred from the ground.

W. H. W., Philadelphia.-I have a setter dog, four years old, who has always been troubled with a wheezing or asthmatic cough. Of late it has become aggravated considerably. Wher rts to run, he coughs half a dozen times ; it then ceases. the starts to run, he coups han a dozen times; it then tied, tugging at his collar will produce the barking or He lives in the house, but gets a run of from four to every day; is in good condition for work at all times; wheezing the table, and receives many a little luxury. Will you please suggest a remedy? Ans. Remove the luxuries and give a very plain gest a tenery. And the state of the state of the state of the state. Medicine is not likely to do any good unless it be a mild purge. The condition you describe often follows an attack of distemper.

G. F. H., Hartford.—I have a setter bitch puppy ten months old, suffering from paralysis of ber bind legs, caused by distem-per. She is unable to stand at all on account of the paralysis. No running from the eyes ornose : in fact, the distemper has troubled running from the eyes or nose; in fact, the distemper has troubled her but little at any time, and I had supposed sho had recovered from the disease entirely, when this trouble appeared. It did not come on from exposure or over feeding, as cat meal and milk has been her principal diet. Considering her condition she has considerable strength and very good appetite. Have been giving quinine and strychnine, and occasional use of battery. The paralysis has been lasting about two weeks with a tendency of increasing. Can anything be done? Ans. Substitute one-quatter to one-cipith of nux vomica extract for strychnine, and you are doing all that can be done and advantage in such cases. doing all that can be done to advantage in such cases

doing all that can be done to advantage in such cases. F. P. D., Jr., Maryland.—I. Can you inform moif dogs are subject to gravel? I lost a fine English setter several weeks ago; the was only sick two or three days. After death, the examination showed that be had two large stones in his bladdor, and both it and his kidneys had mortified and suppurated. I do not understand bow be could have been so afflicted. I have owned him three years, and he has not been sick a day. Are dogs subject to this, and is there any cure? 2. Please inform me of the most reliable party from whom to purchase a good, young setter. Ans, I. Dogs are subject to gravel or stone, Just as man is, and from similar causes. The annoyance can be allayed, but the chance of a radical cure is very slight. You have neglected to state the stee of the stones; let us hear from you on this point. 2. We cannot recommend any special dog man. We call your attention to our kennel advertisement. our kennel advertisements.

Moders—Turpentine is a good vermifuge, but apt to inflame the kidneys. To prevent this an omulsion should be formed by mixing it with yolk of egg and olive oil; the dose for a medium sized dog is a teaspoonful. Venice turpentine is a milder remedy. It may be given in doses of a drachm, made into pills with flour or with arean nut powder freshly grated. The dose of nut is two grains to every pound weight of the dog, but no dog should be given more than two drachms. A strong and mature dog should be kept without food for twenty-four hours before giving a vermifuge. Give a tablespoonful of olive oil the evening before giving the vermifuge: and the worm medicine should always be vermitage. Give a tablespoont of coive oil the evening before giving the vermifuge; and the worm medicine should always be followed by a purgative a few hours later. In the case of tapeworm the remedy or remedies selected must be persevered with until the head of the worm is expelled, and in all cases the worms and all discharged faces should be either burned or mixed with some powerful disinfectant and deeply buried, to prevent propagation of the parasites by their ova-

#### PUBLISHERS' DEPARTMENT.

A SUGGESTION TO SUMMER TOURISTS.—A change of climate is at all times more or less dangerous. There are elements in a new atmosphere which are injurious, especially when the system is exhausted by care and overwork, and which should be guarded. against. After careful observation we have come to the concluagainst. After careful descriation we have come to the consen-sion that Warner's Safe Kidney and Liver Cure is the best pre-ventive for atmospheric evils, and that it will restore health and vigor sooner than any remedy which has ever been discovered.

# J. Stevens & Co.'s Celebrated Arms.

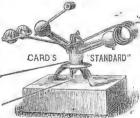

PINE QUARTER, AMELIA G. H., VA., Jan. 22d.
Messs. J. Stevens & Co.;
GENTLEMEN.—I was ignorant of the fact until
I received, you letter that the gun I got from
you was "cloked," and having been reading
to use your gun and put my others away. I am
happy to inform you! I have made some capital
shooting with it, especially at long shots, and I
find it kills the birds much cleaner than the gun
day I saw from my window two squirrels on the
ground, about a foot apart. I put in a paper
drachmen of now deal of the control of the control
it, and the other crawled about three yards and
died. I measured the distance with a tape and
died. I measured the distance with a tape and
died. I measured the distance with a tape and
died. I measured the distance with a tape and
died. I measured the shooting powers of the gun,
any game we have here, I shall be much colliged
if you will inform me whether the gun is a "full"
or" moderate choke."

Philip H. Gossex.

# Forest & Stream.

NEW YORK, THURSDAY, AUGUST 12, 1880.

Advertisers are respectfully quested, in all cases where it is possible, to send in their advertisements by Saturday of each week before the issue in which they wish them to appear. We cannot receive new advertisements, nor make changes in those already standing, later than Tuesday morning.

WILD RICE.—We are in receipt of numerous inquiries for wild rice. At present none is in the market : it is too early. When the harvest is gathered, those who are collecting it will give due notice in the FOREST AND STREAM. We shall then repeat full instructions for its

PALACE CARS FOR SPORTSMEN.-The cars "Davy Crockett" and "Izaak Walton" are fitted up expressly for the convenience of sportsmen. As there will probably be a great demand, this autumn, for these comfortable moving hotels, we recommend our friends to apply early to the Pullman Palace Car Company, in order to secure their accommodations without fail.

-Those who read Porter's Spirit long before the FOREST AND STREAM was published will recognize in "Rough Notes from the Woods," published to-day, the same pleasant that "Nessmuk" used to contribute to that journal. We have further notes on hand, and shall publish them shortly.

-The leader of the crew making the reprisal, related by "Awahsoose," is now a fish warden-evidently the right man in the right place. The moral of that tale, by the way, is not wholly for poachers; it may well be ap-plied by organized or non-organized game protective societies. If a net catches fish when fish should not be caught one remedy is to burn the net.

#### THE MICHIGAN SPORTSMEN'S ASSOCI-ATION.

THIS is one of the best organizations of sportsmen I in America. It is what all such associations should be, a protector of fish and game : and its deliberations are of the most interesting character, comprising essays upon all subjects which come within the scope of the organization and which are followed by discus-We are in receipt of their third annual report of the fifth annual session of the association, which was held at Bay City, Feb. 3d to 5th, 1880, a neat pamphlet of one hundred pages, to which is appended a synopsis of Michigan game, fish and allied laws. Instead of being a mere pigeon shooting club, it devotes its time to considering the habits of fish and game, the laws for their protection during such times as an increased knowledge of their habits requires, and even the introduction and acclimatization of such species as may seem suitable to the climate of the State. At the last meeting President Holmes, in his address, while of the opinion that the migratory quail. Coturnic vulgaris, was hardly suitable for their State on account of its habits, which might impel it to leave for a warmer clime as soon as the young were fit to travel, strongly recommended the introduction of the "gray partridge" of Asia and Africa, Perdic cineria, as an addition to the game birds.

A paper by Mr. Fred Mather was read, appealing to the association to save the grayling from extermination, and citing cases where the spawn of this fish had been artificially taken and the young reared in this country, notwithstanding there was an impression abroad that this had never been done. Mr. Geo. H. Jerome also wrote a brief note on the same subject, and Mr. McLean advocated the right of the settler to kill game to supply his wants, to which most of the members gave assent. Mr. Frank Clark gave his experience in bringing East and preeding the rainbow trout, Salmo iridea, with which he had been very successful.

The Committee on Nomenclature made a report which was followed by that of Mr. E. H. Gillman, chairman of the Committee on Sporting Dogs, in which he treated dog culture, management and field trials, in a very able manner, and to which we had occasion to allude in a former article. Mr. J. G. Portman, Superintendent of Michigan Fisheries, read a paper on fish culture in the State, in which he spoke of the attempt to introduce shad into the lakes, the land-locked salmon, the eel, the trout, the whitefish and the carp. The eel had been planted to the extent of about 700,000 in the years 1877-8. At the Pokagon hatchery Mr. Portman has hybrids of Salmo fontinalis and S. namayensh which are fertile.

Following the report of the Committee on Laws for the Protection of Game, Mr. C. W. Higby read a paper upon the subject, in which he advocated reducing the market value of game by preventing its shipment out of the State, or shortening the time in which it was allowed to be killed; also to pass a law punishing persons who killed deer for the skins and left the carcasses to rot. The question of shortening the open season for deer by making it from Oct, 15th to Dec. 1st, instead of, as at present, from Sept. 15th to Dec. 15th, was, by general conent, allowed to lie over until another year. Mr. D. H. Fitzhugh, Jr., then offered a resolution of regret at the death of Prof. James W. Milner, of the United States Fish Commission, and an obituary paper was read on the death of Dr. Thomas A. Brewer. Senator Palmer referred to the custom of shooting pigeons from a trap, and hoped that the association would discountenance it, whereupon Mr. Colburn showed that the association had never recognized the question of trap-shooting as a legitmate one for discussion in its deliberations; that the association had more important business in hand than the agitation of a question which would only serve to bring discord into the convention and cripple its effectiveness for good, the opinions held by the members upon this subject differing widely; and closed by quoting from Mr. Mather's paper his sterling compliment to the association, in which he pronounced it one of only three clubs in the United States whose meetings are for the the FOREST AND STREAM.

protection of game instead of pigeon slaughter and shooting for prizes.

The good that it is possible for the Michigan Sportsmen's association to do is almost unlimited, and we are glad to see that its work is meeting with appreciation, an evidence of which is the increased demand for its pullished reports, which in 1878 was only 1,000 copies; in 1879, 1,500, while the present year witnesses an edition of 2,000 copies distributed gratuitously to Michigan sportsmen and to all others who are thoughtful enough to inclose a stamp. This is doing excellent missionary work and is well worthy of consideration by all bodies of sportsmen who desire to elevate not only their sport but themselves from the mere routine of slaughter, shooting and fishing for count and for brag, to the highest level of sportsmanship which propagates and protects the game for the sake of healthful recreation in forest and by stream, and which never allows sport to degenerate into slaughter nor approach extermination.

#### SIXTEENTH CENTURY DOG LORE.

THE "foure good dysportes and honest gamys that is to wyte, of huntynge: hawkynge: fysshynge: and foulynge," must have held a high place in England in the Fifteenth and Sixteenth centuries, for some of the first laborious and clumsy efforts in printing were devoted to rehearsing their merits and to instructions for their pursuit. English books of sport are almost as old as the English printing-press. The first press established in England was that of Westminster in 1477, after which came, two years later, that of Oxford, and the third at St. Albans in 1480. We do not know even the name of the first printer of St. Albans; we only know that he was a schoolmaster, for Wynken De Worde, who reissued one of his books, tells us that the original was printed by "one sometyme scolemayster of Saynt Albon," and we could wish that more than these meager details had been left to us of one to whom, even at this late day, sportsmen of antiquarian tastes owe so much pleasure. For among the eight books-six of them devoted to education—printed during the six or seven years after 1480, and before the worthy man relinquished his new labor for the old work of tutoring, was "The Book of Hunting and Hawking, and of Cote Armour," or what is better known as the "Boke of St. Albans." This rare old work was printed in red and black, and its crude type filled twenty-eight pages, upon the last of which was the colophon: "Translatyt and compylit togedyr at Scynt albons the yere from thincarnacion of oure lorde Jhu Crist. M.CCCClxxxvi."

This old work has taken its place among the rarest of literary and antiquarian treasures. It has been estimated that probably not more than fifty copies of the original edition were printed, and of these, now after a lause of four centuries, those which have survived the destructive agencies of fire, damp, the worm and neglect, are extremely rare, and all but one of them almost inaccessible. Imperfect copies are in the Bodleian, Oxford, and the University Library at Cambridge, and a fourth, having been sold for old paper at a penny a pound, afterwards lingering on a kitchen shelf for many years, and passing neglected and unknown through a great many like vicissitudes, finally came into literary hands, and is now exhibited in a glass case in the King's Library of the British Museum. We are glad to learn from the Antiquarian that a fac-simile reprint of the "Boke" is now being prepared for publication, which will afford the curious reader an opportunity of studying over the quaint illustrations and the old-time spelling and dialect of the specimen of Fifteenth Century lite-

A part of the book, the charming "Treatise of Fysshvnge with an Angle," attributed to Dame Juliana Berners, was reprinted in London in 1827, and in 1875 an American reprint of this edition was edited, with appreciative care, by that well-known and genial angler, Geo. W. Van Siclen, of the New York Bar, and is doubtless now to be found on the library shelves of many readers of It was half a century or more later that Roger Ascham published his "Toxophilus," a book to archers what the "Fysshynge" is to anglers. It is somewhat curious at this day to read of the worthy "reader to Queen Elizabeth and her secretarie for the Latin tongue" as distinguished for his classical attainments and much given to play and cock-lighting. Latin professorship chairs and cockpits is an association altogether too bizarre for the tastes of the present, but it was not so then, and of the two books which Ascham wrote, the "Scholarca" and the "Toxophilus; or, Schole of Shooting," the latter won for him the most distinction, and to it he appears to have owed his clurreh preferment, for he says: "I once wrote a little booke of Shewtynge, which King High and allow, that he gave me a living for it."

Less known than either of these two books, but none the less quaint and charming to the delver in ancient sport ing lore, is the treatise "On Englishe Dogges," by John Caius, published in 1576, and the first book on dogs ever printed in the English language. Conrad Gesner, the preface to the well disposed reader tells us, "a man, while he lived, of uncomparable knowledge and manyfold experience, being neuer satisfied with the sweete sappe of ynderstanding," requested John Caius, "a profound clarke and rauenous deuourer of learning, "to write a short treatise of such dogs "as were engendered within the borders of England." To the accomplishment of this task, we are assured, Caius spared no study, withdrew himself from no labor, repined at no pains, forsook no travails, refused no endeavor, pretermitted no opportunity or circumstance; and his friend adds: "The sundry sortes of Englishe dogges he discouereth so enidently their natures he rippeth vp so apparently, their manner be opened so manifestly, their qualities he declareth so skillfully, their proportions he painteth out so perfectly, their colours he describeth so artificially, and knytteth all these in such shortnesse and breuity, that the mouth of th' adversary must needes confesse and give sentence that commendation ought to bee his rewarde, and praise his deserved pension." This is high praise, and if to our modern ears it sounds bombastic, we must remember that it was written in an age when such hyperbole was much in vogue, and we may well heed the apologetic remarks of the translator: "As for such as shall snarr and snatch at the Englishe abrydgement and tears the Translatour, being absent, with the teeth of spyhtfull enuy, I conclude in breuity there eloquence is but currishe, if I serue in their meat with wrong sawce, ascribe it not to vnskilfulnesse in coquery, but to ignorance in their diet.'

A copy of this old work is preserved in the British Museum; this Mr. Hugh Dalziel carefully copied, and an edition has been recently published in England, preserving the exact original line for line, and error for error. Looking through its pages we have found so much pleasure in the homely diction, the antique instruction and the charming simplicity of the text, that we have thought it well worthy of a place in our columns, whereby, it may be, we shall help to erect for the author "the monument of immortality" which his translator three hundred years ago bespoke for him.

#### ANGLERS AND ANGLING.

FORTUNE," says Machiavella, "likes an ardent wooer and turns the cold shoulder to one who delays." "All is fair in love and war." In angling all is not fair, but activity, early rising, stealthy approaches and delicate casts come under the head of legitimate means of capture. The fish admire determined efforts, and reward them as fortune rewards the ardent wooer, yet let there be no unseemly haste, bustle or anxiety about your movement, but be very quiet and apparently unconcerned, for by those tokens you manifest the instincts of the gentle angler himself.

The most successful anglers are the men who are fre quently called slow-coaches, but their slow and careful movements are not incompatible with Machiavella's fortune hunters; the quick, nervous, impetuous men who act before thinking, rarely make good anglers. Their lines are too frequently caught in branches overhead, or their hooks fasten to some submerged snags, accidents which will happen to any one, but the slow-coach has the advantage in his method of extricating himself from the situation. One may perhaps indulge in a variety of sulphurous ejaculations which frighten the fish, while a few illtimed twitches fasten his tackle more securely, and the natural consequence follows-he loses his hooks as well as his head. Slow-coach, when he gets into trouble. calmly surveys the situation, goes to work the right way. and in a few seconds has conquered the predicament and resumed his fishing, while the other fellow has waded ashore to repair the Jamage he has sustained.

A queer compound is the angler—a bundle of contradictions! He is the antipodes of himself. He delights in the protection of God's creatures. He is a cruel deceiver, using the finest and most delicate implements in the carefullest manner, unrelenting in the attainment of his object; but he is also kind-hearted, quiet, patient, gentle, with a cheerful word and a helping hand wherever it is deserved and needed. He handles the fish with womanly

tenderness, but their struggles awaken no sympathy. See how skillfully he manages his tackle; not a kink in line or leader, but perfect harmony from reel to stretcher fly; the tip of the rod never for an instant losing the feel of the line, which doubles and turns so gracefully, describing all the curves of beauty and never interfering with itself. How lightly, with perhaps the faintest splash, with "a sound so fine that nothing lies twixt it and silence," does he place his feathery counterfeits on the water, the leader smooth and straight as a newly made candle.

Placing the flies gently and noiselessly as fall the snow flakes, may indicate the acme of fly casting, but if they land like a drop of water, with the softest plash, they will not frighten the fish, and you will catch as many as the angler who preaches snow flakes and thistle-down. One can be more careless while fishing American waters -though carelessness in an angler is always inexcusable than if he were angling in most of the trout streams of Great Britain. Our trout have not all as yet learned that curiosity sometimes leads to certain death, and it is this ability to capture them so comparatively easy that in many cases makes the American angler the inferior of his English and Irish brethren in all the minutiæ attendant upon the gentle art. Had we been schooled as carefully as our transatlantic friends, we would not have sometimes to wonder at our ill-luck. Indifference to minutive will counteract many admirable qualities, for the trout is himself an admirable sportsman in certain waters and seasons, and at times attains the highest pinnacle of sagacity. Our best rod makers turn out work equal, if not supe

Our best rod makers turn out work equal, if not superior, in every respect to that of any foreign makers. Our flies are perfect in strength and beauty, and the variety is infinite. Every winged insect, from the creation of the world to the millennium, and perhaps earlier and later, is imitated close enough to deceive even the originals.

Year by year our anglers are improving their methods and implements, as the trout are growing wiser and wiser, until now it requires, on the more frequented streams, the utmost skill and delicacy to capture so wary a general, one so well versed in all the expedients that experience and natural cunning bring to him in his search for the morning and evening meal. There he is a sentient being, cunning as Iago and thoroughly up to the "tricks that are vain."

MILLARD.

#### BAY SNIPE SHOOTING.

IL-LOCALITIES.

"Seek'st thou the plashy brink
Of weedy lake, or marge of river wide,
Or where the rocking billows rise and sink
On the chafed ocean side?"

WHO can tell of the habits of our wild fowl and aquatic birds as well as the men who, day in and day out, in cold and heat, and in all kinds of weather, follow shooting for a livelihood? Unfortunately for the public, these men cannot, for the most part, spare the time to dot down their experience. Indeed, but few of them can write, and what if recorded would be of real value to the shooting world, is lost. The educated sportsman is rarely of assistance in this matter, for he, as a general thing, leaves everything to his bayman, and with a profound ignorance as to the habits of the birds, learns little and remembers but little, after a week's shooting, save the number and quality of the fowl brought to bag during his holiday. If he has had good shooting, he is generally liberal to the caterer to his sport; but for the life of him he cannot tell why the stools were set to windward, or why he had better or worse shooting than the guns in the other "rigs." Our experience has taught us that too often the purely scientific man knows even less, and that many works on ornithology abound in absurd inaccuracies, which lead to "confusion worse confounded." True, the scientists tell us the measurements and weight, and the coloring and shading of each bird but often these descriptions are of the faded plumage of the dead specimen, and not of the live fowl. ored plates are introduced into their works, they are often so unlike the bird they are intended to represent that if it were not for the name underneath it would be impossible to identify them. In fact, we have seen several which resemble Egyptian hieroglyphics more than birds that have been seen to fly. It is from works of this kind that almost all our sporting book writers draw for their material, and not from real experience: hence errors and traditions are handed down to us, and continued ignorance is the result.

From the Bay of Fundy in the North, to the Florida Reefs in the South, there are miles of the Atlantic coast shielded by long sand bars and shoals, which, at every ebbing tide, abound with every variety of aquatic food. At one time or another throughout the year each locality is visited for a short or long period by the bay snipe, Leaving the South early in the spring, they seem drawn by some magnetic influence toward the North, passing this vicinity in May, the date being regulated according to an early or late season. Once in their home in the far North, they speedily set about nesting and the rearing of their young. This is soon accomplished, and then their

return flight begins, the old birds preceding, followed by the young several weeks later. But it is a mistaken idea to suppose that all the varieties of bay snipe seek the North to pursue their matrimonial inclinations. Several kinds, and especially the willet and some of the plover, breed to the south of New York. It is during the summer flight that the bay snipe run the gantlet of the thousand stands that dot the coast from Maine to Eastern Virginia. We shall not attempt to specify each locality, particularly those that are remote, but simply mention the places that are easy of access and well known to the sportsmen of this vicinity.

Beginning at the north, we follow to the south the line of coast of those States on the Atlantic scaboard, mentioning the names of the counties of each in their geographical order, and the places where more or less shooting can be had at this season. Of course, the shooting begins first at the North, but the rapidity with which the birds make their flight causes the first guns to be echoed along the coast, even to the far South, in quick succession.

LIST OF PLACES WHERE BAY SNIPE ARE SHOT

Maine—Washington County.—The Island of Grand Menan. The island and bars along the entire coast of Lancock, Waldo, Knox, Lincoln, Sagadahock, Cumberland and York counties.

NEW HAMPSHIRE—Rockingham County.—Rye Beach and Hampton.

MASSACHUSETTS—Essec County.—Plum Island, Ips-wich, Cape Ann, Gloucester, Beverly, Marblehead, Salem and Lynn. Norfolk County.—Randolph and Cohasset. Plymouth County.—Marshfield, Duxbury, Clark's Island, Plymouth and Manomet Point. Burnstable County.—Sandwich, Chatham, Queshnet, Wood's Hole, and at almost all the towns along the coast, on Cape Cod and Buzzard's bays, and the ocean side. Bristol County.—South Darthmouth and Quansett.

Rhode Island—Newport County.—At all the islands, Washington County.—Point Judith, Block Island, Bristol, Peacedale and Watch Hill,

Long Island.—Suffolk County.—Fisher's Island, Plum Island, Ram Island Shoals, Orient Point, Montauk Point, Bridgehampton, Southampton, Shinnecock Bay, Moriches and Great South Bay, and, indeed, all along the south shore.

STATEN ISLAND—Richmond County,—Great Salt Kills.
NEW JERSEY—Monmouth. County,—Manisquan Inlet.
Ocean County,—Squan Beach, Burnegat Bay and Long
Beach, Burlington County,—Tuckerton, Atlantic County,
—Brigantine Beach, Absecom and Somer's Point. Cape
May County,—Peck's Beach, Townsend Inlet and Leaming Beach.

DELAWARE—Sussex County.—Lowes, Rehoboth Bay, Indian River and Long Neck.

 $\label{eq:MaryLand-Worcester County.-Hammock Point, Berlin and Sinepuxet Beach.}$ 

VIRGINIA— Accomac County. — Chincoteague Island, Watolop's Beach, Gargathly Inlet, Assawman Island, Matomkin, Cedar Island, Bucton's Bay, Trout Channel, Little Matchipongo Inlet, Revel's Island and Matulikin, Northampton County.—Hog Island, Sand Shoal, Great Machipongo Inlet, Cobb's Island and Smith's Island.

#### THE ANTHRACITE.

S far as we have been able to learn, the Messrs, A S far as we have been and the street any response to their last letter for Major Geo. Deane, Secretary of the Perkins' Engine Company, for the first communication of the Secretary can hardly be regarded in a serious light in view of the outspoken blunder therein made. As it has now been clearly pointed out to the agents of the Perkins boiler that the grounds upon which they declined the very fair and reasonable challenge of the not tenable, but conflict with the simplest truths of engineering science, it becomes all the more their duty to explain to the satisfaction of the public one of two things : either why the Anthracite dared not meet the coil boilers in a test of economy, or else, upon what grounds the remarkable statements of Major Deane are to be justified. It would be snap judgment to assume that no satisfactory explanation will be forthcoming, and consequently we prefer waiting another week to hear from the proper source. We are inclined to think that, in his first answer, Major Deane was acting upon the advice tendered by incompetent and unworthy counsel, and that he was induced to frame his answer in a hurry, whereas, upon second thought, he would not care to indorse statements which he now knows must have raised a smile among the profession. It is hardly to be supposed that a gentleman, representing such large interests as the Perkins Engine Company, should not be acquainted with the commonest of problems an engineer has to meet; nor does it seem likely that one who has shown such wonderful astuteness in obtaining a vast amount of free advertising for an old resurrected apparatus, fully known these last ten years to the profession in America, should really be in total darkness concerning the line of business he represents. For these reasons, we prefer be; lieving that, a stranger in a strange land, the baleful in

fluence of sundry scheming worthies was really at the bottom of the questionable engineering talent now wrongfully credited to Major Deane. All the more reason why an explanation should be forthcoming, unless the Perkins boiler can afford to shoulder the charge of being put forward by persons not competent to judge of

Should the Perkins Engine Company contemplate establishing a branch of their business in America, they will probably thank us for conning them clear of certain individuals of unsavory reputation, who, unfortunately appear to have "rung in" with the company's gallant Secretary to the extent of placing the latter's ability in a wrong light before the public. Connection of any sort with confidence men can do the company no good, and the sooner they get a clear conception of the lay of the land, the better.

#### FISHERY EXHIBITIONS.

THE success which attended the great exhibition at Berlin has set the fashion, and fishery exhibitions are, no doubt, destined to become more or less popular. Germany has had another one, at Wurtzburg, which was not international in its character, although we learn that Messrs. S. Allcock & Co., of Redditch, England, makers of hooks and fishing tackle generally, received a diploma, a gold medal and a "prize of honor" for their exhibit. This firm also received a gold medal at the Berlin Exhi-

It is now proposed to hold a similar fishery fair in England, this fall, under the management of the Norfolk and Suffolk Fish Acclimatization Society, and Norwich has been selected as the place for it. This one is to be somewhat international in its character, we infer, from the fact that the Fischerei Verein of Germany have signified their intention to "assist," whatever that may mean, but it is certainly too soon after the splendid exhibition in Germany to hold an "international" one; surely a breathing spell of a few years is necessary before the United States would entertain the idea of being officially represented, if it ever docs again. The United States Fish Commission not only has much other work to attend to, but there are many other reasons why there are objections to a display by our government, besides the ex ense, the main one being the damage done to the collection belonging to the National Museum, which will soon be set in position in the new building, many articles in it being impossible to duplicate. Of course such exhibitions are open to private exhibitors, but somehow very few of them had enterprise enough to take advantage of it as the English manufacturers did at Berlin, where almost the entire display in the English department was made by individuals, We imagine that it will be a long time before such a fishery exhibition as the one recently held in Germany will be attempted, for the reason that we do not know of any fishery organization in the world which has the enterprise to conceive and the courage to attempt what was done by the Deutsche Fischere Verein. The Norwich Exhibition has also the promise of support from Messrs. Buckland and Walpole, Inspectors of Fisheries of Great Britain.

THE TEAM CAPTAIN AND THE CUSTOM HOUSE,-Col. Bodine's lot just now is not a particularly happy one He made an error in getting his personal effects past the scrutiny of the customs officers, and now every exchange from the country over has its little fling at the leader of the American riflemen in Ireland. It is really to be re gretted after such a brilliant run of luck and skill on the field of Dollymount that the record should be smirched by a misunderstanding with such an object as a tide-waiter of the New York Custom House. But such was the fact, and rolls of silk and packages of kid gloves in the Colonel's gun case, without a corresponding notice of their presence on the passenger declaration of the late team captain, makes an annoying contradiction to be rectified. There was manifestly no intention at smuggling, as there was no attempt at concealment. When the team of 1875 came home the display of baggage was somewhat enormous, and particularly excessive as compared with the amount taken out. All of this miscella-neous collection of valuables were then passed by the customs officers without word or question, intending by the act to have a compliment shown the team. Relying on something of the sort again, the Colonel found, when too tate, that he had miscalculated, hence the position of affairs to-day. It is unfortunate that any such an occurrence should have taken place, and it is only to meet in some measure the current misapprehension that we speak

THE CANADIAN MATCH .- During the present week Creedmoor range has been occupied pretty constantly by the practicing of the Canadian team. The gentlemen who have crossed the border this time have come to win. They are taking time, and proceeding along with a system and care which augurs well for their success They are wooing the goddess Fortune, as the really sucvessful rifle shot always does, by assiduous court. The men do not lack familiarity each with the other, and

with rifles all of a make, and these, too, American rifles it will look like a breath of bad luck for them to be beaten. The probabilities of the record are, of course, in favor of the American, or Amateur Rifle team; but the gentlemen of the Amateur Club will not regret a defeat at the hands of their kindly neighbors from across the lake. To-day the team visit Manhattan Beach for a formal dinner, and the match on Saturday will be carefully noted by our special rifle contributor, and the whys and wherefores of victory or defeat duly set forth,

TO COLLECT SEAWEED. - Few objects of natural history are more interesting than the scaweeds and algae of our coasts when properly preserved, and a stroll on almost any beach will reveal to the collector a number of beautiful forms, which are well worthy of the slight trouble involved in their collection and preservation.

Seaweeds are such beautiful objects when fresh, and are so unsightly when shriveled and dried up, that it seems desirable to give full directions to those who may be interested in this department of botany, but who are ignorant as to the best method to be employed to make these objects retain their colors. The present time, too, when so many of our readers are at the seaside, seems peculiarly fitting for the publication of such directions, We publish elsewhere very full directions for collecting algae, which we owe to the courtesy of Prof. Daniel C. Eaton, Professor of Botany in Yale College, Prof. Eaton is one of the first authorities in the country on seaweeds. and we desire to express here our appreciation of his kindness.

GREENE SMITH.

FEW men were better known to the sportsmen of America than was Greene Smith, a brief notice of whose death on the 23d ult. was given in our columns a fortnight ago. To-day we publish the accompanying portrait, which we have spared no pains to make faithful to the photograph from which it was engraved. Those who knew the original will at once recognize its fidelity.

Greene Smith was born in Peterboro, N. Y., in the ear 1842, and was therefore at the time of his death just in the prime of life. He was a son of the late Gerrit Smith, and was given a superior education.

At an early age he manifested the taste for natural history pursuits, the gratification of which, in later years, was his chief employment and pleasure. In his younger days, too, he exhibited those qualities of char-acter which made him so remarkably a friend of every one with whom he was associated. Greene Smith had a strong social disposition, and his affability drew friends about him at home and abroad. He enjoyed traveling, and spent much of his time away from home; but, as has been happily said of him, "he never got far enough away to find any enemy,"

Although coming of a family somewhat prominent in public life, and naturally possessed of those qualifications which might have given him like prominence, his inclination led him elsewhere, and his life was passed mainly on the family estate, and without much that was note worthy. He was at one time professor of ornithology in Cornell University, but his interests always centered closely in his wonderful collection of birds, to the perfection of which his time and enthusiasm were devoted.

Among the sportsmen of this State Greene Smith always held a prominent and a very pleasant position. He was the president of the National Sportsmen's Association, of Niagara Falls, in 1875, and in 1877 presided over the Convention of the New York State Sportsmen's Asso ciation for the Protection of Fish and Game.

For many months preceding his death it had been evident to his friends that recovery from his pulmonary complaint was impossible, and for several weeks he had been perceptibly failing.

These last weeks were spent in the "Ornithon," or bird-house, among the treasures he had been so long gathering together. Here, propped up in his sick bed and surrounded by all that love and wealth could supply for his comfort, he sought relief from pain by applying himself to a final cataloguing and arranging of his ornithological collection; and it was here that he passed away from earth.

The following description of the "Ornithon" was published in this journal (ROD AND GUN) :-

The following description of the "Ornithon" was published in this journal (ROD AND GUN):—

After walking some two or three hundred yards down a gravel walk, we came to a large building in Gothic rustic style, the sides covered with hemiock bark. On the rustic door is the word "Ornithon" in ivy. The building is in the form of the letter T, the main part being one and a half stories high and 58.03 feet; the L is one story, and 25x40 feet to the ground. The entrance is in the center of the L portion of the building. In the center of the L portion of the building. In the center of the Lyontion of the building. In the center of this room, immediately in front of the door, is a large double desk, surmounted by statuettes, and containing writing materials, with inkstands and study appliances, all rich, and in modern taste. On the timbers over the desk are curved an immense pair of elk autlers, from which depended Sharps and Spencer rifles, with game bag, riding whip, powder flasks, horns, rod, creet, and other sporting implements; also a riding whip which Mr. Smith said once belonged to a soldier in Stuart's cavalry. The sides of the room are hidden by immense glass cases, the one on the right containing specimens of skins, duck, teal, suipe and other game birds; also a darge variety of song birds, lerons, swans, etc., in a fine state of preservation. Behind this case is a gun-rack fitted with drawers, containing amunition, shot, wads, shells and shooting fixings. The case on the other side of the room is of the same size, and contains some of the finest mounted specimens we had seen. Among them were the English woodcock, European kingfisher, cuckoo, a whooping crane (of which there are very few specimens in this country), a pair of black swans from Australia, a roseate spoonbill, monster owls, hawks, pigeons and other birds, with study foxes and quadrupeds, many rare shells and curiosities of various kinds. Behind this case is a well-filled book-case, containing a good collection of modern literature, in which are th

best books and many rare works in sporting and natural his ory.

The entrance to the main building is about fifteen or twenty feet wide, and in the center stands a beautiful fountain of cool water, with a few speckled beauties sporting in the crystal flood. A grand wide stairway leads to the upper part of the nain building, and on either side are large rustic rooms inclosed with wire screens. The room on the right had a rocky bed, with a stream of water flowing through, and was exclusively for song binds, and would accommodate upward tailwilding for some pinds, and would accommodate upward of a hundred without crowding their movement. On the left, in the main room, is a miniature pond, with rock work arranged especially for ducks and other aquatic birds. Beyond this is a large wire room used as a kernel.

We turn to the right, and there find a loading table for guns and ammunition, and in a cosy nook, neatly arranged, are ground and plunge traps, and all the paraphernalia for trap shooting, according to the most improved plans of English and American rules. On the left side of this loft or large balcony we find the professional tools of scientific draughtsman and civil engineer, all bail out in order repart for use not show the state.

sional tools of scientific draughtsman and civil engineer

left side of this loft or large balcony we find the professional tools of scientific draughtsman and civil engineer, all laid out in order, meant for use, not show, but a rich man's, nevertheless, love for their use being shown by the perfection and finish of the tools.

In another case are the appliances for taxidermy. A second collection of books is found in this department in keeping with this subject; and here we found Wilson's Ornithology, 9 vols., of 180s; Charles Lucien Bonaparte's work of 1895, that'ols Lucien Bonaparte's work of 1895, that'ols; Audubon's complete works of 1856; also John Cassin's Appendix; The birds of North America, by Spencer F. Baird, John Cassin and George N. Lywrence, of 1809; Baird, Brewer and Ridgway's N. A. Birds, of 1874, and all works of the best authors complete, not forgetting flies of American Sportsman and Rod And Gux.

The walls throughout the building are covered with engravings and specimens, mostly fline illustrations of birds and sporting secnes, together with trophies of the chase, specimens are the spikes of ibex, hartbeets blessbok, eland, gnu, springbok of Africa, the gazelle and chamois of Switzerland, antelope and buffalo from the plains. Bird cages without number, containing song birds, hang from the timbers. Also a variety of trout and salmon rods, with flies attached, ready for a cast. Trailing arbutus, clematis, wisteria and other creepers cover the walls, draping all unoccupied spaces. butus, clematis, wisteria and other walls, draping all unoccupied spaces.

CELEBRATED SHOTS .- Dr. and Mrs. John Ruth, the celebrated California experts with rifle, shot gun and pistol, are now in this city, and it is to be hoped will before long give a joint exhibition of their skill with the arms that they so well know how to handle.

Dr. Ruth we find is well acquainted with our old friend Major Frank North, himself one of the best rifle and pistol shots that we have ever seen, whose name is so vell known west of the Missouri River as Commander of the Invincible Battalion of Pawnee Scouts, Major North's letter, recommending the Doctor to the public as one of the finest shots in the world, is a document to be proud of.

Dr. Ruth has just received from William Read & Sons of B ston, one of Scotts' hammerless guns, of latest model, and will use it in all his exhibitions and matches.

-The Virginia mountain trip, of which we have already made extended and commendatory notice, will begin Sept. 9th, and not, as it was at first proposed, Sept. We have reason to believe that those who join the expedition will find it a rarely enjoyable mode of pleas-

## The Sportsman Tourist.

A MORAL TALE FOR POACHERS.

A MORAL TALE FOR POACHERS.

It was in the days before there were any laws in our State for the protection of fish and game, or any State Assemblian for the Protection of Fish and diame, or any State Assemblian for the Protection of Fish and diame, or any State Assemblian for the Protection of Fish and diame, or any State Assemblian for the Protection of Fish and diame, and explaid diamers and—what else? Any one could shoot, trap, net and snare from one end of the year to the other without fear of man or act of legislature, and no fish, bird nor beast that swann, flew or ran wild, had any friends but the few sportsmen and anglers who preached and practiced and were a law unto themselves. In those happy times there were two market fishermen named Andre and Joe, who, in the exercise of their rights as free and newly naturalized citizens of the United States, saw it to hedge Womdakatatuk with a fyke, and so prevent, to their own great profit, the passage up stream of all fish that sought to go thither in quest of food or spawning grounds. No one up stream could get a lish. Anglers in the upper waters sat like Patience on a monument, only swearing more than smiling, at grief—and went down, with not a bite to brag of bin those of mosquitos, wickedly cursing these honest fishermen, who had only taken what belonged to them—for were not all the fishes of or waters created especially for Canneks to catch and self: But some were naughty enough to rebel against this heavenly decree, and took up the net of Andre and Joe, who then prepared to defend their rights. Andre loaded his Queen's arm with a deadly charge of BB, and swore a double-barrelled coath in bac French and worse English "dat if he ketch any Yankee 'round hees not, he d sting it worse as a new' of bumbly-bee!" and when he and his companion had set their net at twilight, they tide their sow to the head stake of the fyke and sat sunoking and gibbering, alert for the fee.

But even the tongue of a Canuck will tire in time, and his powers of suction will not endure

#### ROUGH NOTES FROM THE WOODS.

Moose River, July 21st.

SHE'S all my fancy painted her, she's lovely, she is light. She waltzes on the waves by day, and rests with nie at night. But I had nothing to do with her painting. The man who built her did that. And I commence with the cance, because that is about the first thing you need on entering the Northern Wilderness. From the Forge House, toot of the Fulton Chain, on the west, to Paul Smith's Lower St. Regis Lake, on the east, is ninety-two miles. About five miles of this distance is covered by carries; the longest carry on this route is about one mile: the shortest, a few rods. If you hire a guide he will furnish a boat and carry it himself. His boat will weigh from sixty to one hundred pounds, and will carry two heavy men, with all the dunnage you need. He will "take care" of you, as they express it here, and will work faithfully to forward your desires, whether you be artist, tourist, angler or hunter. His charges are Moose River, July 21st.

will work faithfully to forward your desires, whether you be artist, tourist, angler or hunter. His charges are \$2.50 per day, and found. The tired, overworked man of business, who gets away from the hot, dusty city for a few days or weeks, cannot do better than come to this land of lake, river and mountain, and hire a guide. What the nunle or mustamy is to the plainsman, the boat or canoe is to guide, hunter or tourist, who proposes a sojourn in the Adirondacks. And this is why I propose to mention at some length this matter of canoeing and boating. Being a light weight and a good canoeman, having the summer before me, designing to haunt the nameless lakes and streams not down on the maps, and not caring to hire a guide, it stands to reason that my nameless lakes and streams not down of the maps, and not caring to hire a guide, it stands to reason that my cance should be of the lightest, and she is. Perhaps she is the lightest coalre-built cance in the United States, or anywhere else. Her stems and keel are oak, her ribs red elm, her gnuwale spruce, and six pairs of strips, three-six teenths of an inch thick, with copper fastening from stem to stem, leave her weight, when sandpapered ready for the paint, fifteen pounds nine and a half ounces. The paint adds about two pounds. She is ten feet long, twenty-six inch beam, with eight inches rise at center, and, propelled by a light double paddle, with a one fool power in the middle, gets over the water like a scared loon. I propose to take her a rather extended trip be-

fore snow flies, if she does not drown me. I reckon her carrying capacity, in ordinary weather, at 150 pounds. If she proves reasonably safe on the larger lakes of the wilderness, she is an achievement in the boat-building line. She was built by J. II. Rushton, of Canton, N. Y., and is by several pounds the lightest cance evermade by him. I will only add that she is too light and frail. I would recommend ten and a half feet in length, with thirty inch beam, and ribs two inches apart instead of three. Such a cance wound be stanch and safe for one, and need not weigh more than twenty-two pounds. She can easily be carried on the head, in an inverted position, first placing a blanket or an old coat on the head by way of cushion. When I reached here, just one week ago, irred with a twelve mile ride on the corner of a trunk, while I hugged that frail boat like a faithful lover, I only meant to stop until I could get my traps carried through to the Fulton Chain, which, in the case of the canoe, was not so easy. I was in no hurry—the hotel here is neat, well kept and prices very reasonable. While waiting for the man to turn up who wanted to carry the little craft on his head to the Forge House, it dawned on me that I was well enough where I was for a few days. Parties were constantly coming and going, and all stop at Moose River, which is the half-way house between Booneville and the lakes. fore snow flies, if she does not drown me. I reckon ber

lakes. For interviewing guides and taking notes of the region to the eastward, there could be no better point than this; and I needed practice with the canoe before taking her over the larger lakes. Moreover, I came here for a superior quality of water, air and angling, with a little hunting thrown in at the proper season.

What if these things were at my hand, right here, and parties hurrying through post haste to the Brown Tract or the Raquette waters were running away from that they sought? Those coming out of the woods do not, as a rule, claim notable success with the trout. Many of them would eat salt pork oftener thum broiled trout were

or the Raquette waters were running away from that they sought? Those coming out of the woods do not, as a rule, claim notable success with the trout. Many of them would cat salt pork oftener than broiled trout were it not for the guides, and one of the latter told me that "trouting" was poor on and around Big Moose, while he thought Little Moose and Panther lakes not worth a visit. "I could catch all the trout I wanted right around here," he added.

So I overhauled my fishing gear and went in for brook trout, and, as I supposed, found all I wanted; found that I could, by angling just enough for recreation, eatch more speckled trout by far than I need, while there is very pretty lly-fishing at the spring holes in the river. Many gentlemen who go far into the wilderness, at much expense of guides, etc., would be well content with just such fishing as I am enjoying at Moose River. Then there are, within an easy walk of the hotel, several small lakes where deer "water" nightly, and may be "floated" for with a fair prospect of success.

But this is not camping out—not a genuine woods life. We seek the forest for adventure, and a free, open air, Junnter's life, for a time at least. Well, it may be a little tame, but it is very pleasant and healthful, all the same. As for camping for the benefit of open air, bright fires and beds of browse, fresh picked from hemlock and balsam, we have that right here. Just under my eyes as I write, there is an island in the river some twelve rods long by six wide. It is well fundered with spruce, balsam, hemlock, cedar, pine, birch and maple. It is one of the pleasant spots that nature makes and man neglects. The island lies high, with roaring, rushing rapids on the left, and a broad rock dam on the right, which at low water becomes a cool, clean promenade, 100 feet long by forty feet broad. Near the center of this rock is a natural depression, forming a hasin into which the water slowly filters from the river. In this little dock I let the canoe rest at night: against the largest s

#### LONG POINT.

#### "THE HAPPY HUNTING GROUND."

BY kind invitation of my good friend, Sheriff Wood ruff, and with but, a few minutes to P 'k kind invitation of my good friend, Snerit wood-ruff, and with but a few minutes to catch the train, I hastily bundled what few things were necessary into a bag and started to meet my host at the Hamilton Station. On my arrival I met Mr. R. A. Lucas and Mr. J. J. Mc-Kenzie, both gentlemen from Hamilton, who with my-self made a party of four for that "paradise of hunters," Long Point. We went to fish for green bas and enjoy the pleasant breezes and beautiful scenery at all times to be found more the island.

the pleasant breezes and beautiful scenery at all times to be found upon the island.

We arrived at about 7 in the evening of the 21st of May, after a pleasant trip on the Annie Craig from Port Dover. Approaching the dock we were greeted with handerkerchief salutations from friends on shore, conspicuously among whom was that dear old veteran Christian sportsman, Dr. Edgerton Ryerson, whose hale and hearty figure at seventy-seven shows how careful living and abundant exercise, mentally and physically, do to keep age young.

age young.

This charming island is situated on the east end of Lake Eric, and contains an area of about 20,000 acres of land, a large portion of which is marsh, and which affords fine feeding and nesting ground for all the varieties of ducks which breed in this neighborhood, such as mailard, teal and woodduck. Fish of all descriptions abound. The woodland is largely supplied with deer, wild turkeys, partridges, wooncock and sinje. Endless numbers of muskrats, when seasons are propitious for breeding and catching, yield quite a revenue to the company, trapping as they do from 10,000 to 25,000 annually, which tends in some degree to lessen the expense of supporting the four or five gamekeepers. The time of these keepers is spent in watching and protecting the grounds from the inroads of poachers. The caretakers consist of William Leary, steward; Helmer, head gamekeeper, and Jackson, second gamekeeper, all of whom live upon the main island. Morris, Fitzmorris, or "Monty," by which cognomen he is better known, takes charge of the fifteen or sixteen cottages, which belong to individual members of the club, or are used by punters engaged during the shooting season. In addition to these is a club house, in which is the dining-room, a large apartment, finished in oiled chestmut and decorated with stiffed animals, maps and paintings, with an autograph register or tablet of celebrities who from time to time have been guests of age young.
This charming island is situated on the east end of

the club. These buildings are all constructed upon piles, forming a wharf, and distant about two and a half uniles from the island proper, and upon a spot known as the "Carrying Place Creek." This is a most beautiful place for a summer resort: free at all times from dust, smoke and noise, with generally a refreshing breeze to make things pleasant. Each cottage has its cooling room—a sort of "corn crib"—in which each night the birds shot during the day are hung up, and a refrigerator contributes to the many creature comforts that are to be found here. There are a good many celebrities connected with this place, and some few whom I met who have shot in the marsh and hunted the unland game for from sixts to

to the many creature comforts that are to be found here. There are a good many celebrities connected with this place, and some few whom I met who have shot in the marsh and hunted the upland game for from sixty to seventy years; among them Dr. Ryerson, who is perhaps one of the oldest, has spent some months here with his good wife this spring in his jolly little hunting hox, where in his quiet ease, he told me, much of his admirable book on Canada has been written. Then there are the Messrs, Woodruff, of St. Catherines, and others whose names at present do not suggest themselves. Yes, old Peter Price, nearly ninety years old, still trolls about, and his son, Bill Price, a sweet-scented old "geranium," and Bill Woodward, too; and last, but not least, comes the worthy Ayres, who has made the marsh "hum" over and over again with old Westly-Richards, and tells every time she goes off a tale of woe to anything that comes within his reach. There is a little history attached to all connected with the association.

Our fishing party, which consisted of Sheriff Woodruff, Mr. Lucas, Mr. McKenzie and myself, upon our arrival, were coupled off together in cotrages, each with two bedrooms and a sitting-room, furnished with everything to conduce to the confort and case of the wearied hunter after a hard day's sport. Now, this party was essentially a pleasure-bent organization, seeching rest and relaxation from the tolls and cares of husiness from ver-worked brains, etc. Our time was chiefly spent in hooking fivenound green bass. The fish were most abundant, and had the water been more clear we should no doubt have doubled the catch, which, I believe, would average one every three minutes, and, in fact, with two hooks, as many as sixty or seventy an hour were taken. Of course the more scientific disciples of "Isaac," with delicate tackle, such as friend Harris nascd, could not land as quickly as when "yanked out" with a stiff rod and a strong line, but, be that as it may, the fish are most abundant and gamy, and only exceeded This, by the by, was one of the most pleasant trips I can recall. The bay abounds in the largest bass and pickerel

recall. The bay abounds in the largest bass and pleasers on the continent of America.

On Sunday morning quite a number congregated in the dining-room for prayer (and I must here remark that, unlike similar places of resort, the Sabbath is most strictly observed), and Dr. Ryerson preached a most beaustrictly observed), and Dr. Ryerson preached a most beau-tiful sermon. Among the congregation were Mr. Ed-ward Harris, of London, and Mr. Charles Ryerson, pro-fessional gentlemen of entinence, and their wives, who came over to spend Sunday and the Queen's birthday. The hearty way in which the national anthem was sung left but little doubt as to the loyalty of the party

sing left but little doubt as to the loyalty of the party present.

As all pleasures have their end, so had ours, and on Tuesday morning, after a round of handshaking and regrets at leaving, we turned our faces homeward, ere long, I trust, to meet with similar scenes of enjoyment.

No spring shooting is allowed at Long Point. Nesting birds have perfect quiet and find an undisturbed home during the summer season; consequently when the fall shooting commences birds are found in an abundance unequaled anywhere. By the laws of the club, no guns are fired between sunset and sunrise; the result is from 100 to 200 birds a day to each shooter, and I trust that ere long the Munroe Marsh, which is now being ruined by pot hunters at all secsons, will fall into the hands of gentlemen now negotiating for its purchase, and with whom Long Point friends will be able to shake hands and to congratulate each other upon having brought the protection of game to a successful issue.

N. B.—I quite forgot to mention that last summer Dr. Ryerson, in his little skiff, rowed over to Port Ryerse, seventeen miles, preached two sermons and returned; and this spring, when goose shooting, was overtaken by darkness and compelled toremain all night in the marsh. Rolling himself in his blankets, he quietly went to sleep in his boat, and when he returned the next morning was rewarded by capturing nine wild geese.

St. Catherines, Ont.

J. BEVANS GILES.

#### A MIDSUMMER FOX CHASE.

GASTON, N. C.

GASTON, N. C.

H OWEYER unhuntsmanlike it may seem for a practical huntsman of full forty seasons to be engaged in the sport during inidsummer, I must nevertheless give you an account of a red fox chase I had July 234, 1880,

For several days previous the weather had been cool and damp, much like such spells in early autumn, and it occurred to me a good time to reconnoiter to ascertain if the information received a few weeks before was correct, that a den of red foxes had been found on the Mt. Misery plantation on the Roanoke Kiver, five miles above me. The morning was very damp, cool and cloudy, with misty showers at intervals, but in other respects exactly suited for the purposes I had in view. The female red fox invariably provision such days, and I calculated on striking a trail or confronting one, if my information was correct, as soon as I entered the Mt. Misery planation.

on. After ordinary breakfast I mounted and moved up the After ordinary breakfast I mounted and moved up the Roanoke, keeping the Eaton Ferry road for several mides and turning south down a cartway to the hills overlooking the Roanoke, with some eight couple of hounds that I had liberally mushed to take off their fire, soon came upon a moving fox, and some distance from the place I had expected to do so. The pack broke off in full cry, and so loud and furiously that I was started. I was at a loss to determine the character of the game. I could not venture to hark or encourage the hesitating pack, but keeping my silence and hastening to head the pack soon discovered, as in the darkening wood they passed me, that the game was large and a race was before me. But whether deer, rod or gray fox, was not so evident. The run was directly up the Roanoke, over its hills for more then a mile; then due south through a large body of

woods (sacred to the memory of Pious "Jeems"), passing through its entire length and then rounding and returning south to the Mt. Misery plantation. As soon as I heard the backward move I halted to see fox and hounds and to mark positions. In a moment all were upon me. The mushed dogs, with tongues hanging out and tails dropped, were in earnest and doing their work like trained fellows, but sorrowfully. The fox seemed nerfectly fresh, and at a bound moved off, closely pursued by one of the hounds that had been left behind by the pack when it emerged from under the river hills, turning right back into the pursuing pack. Up to this point things looked discouraging to her, and were so but a temporary break, followed by only a minute's confusion, proved a fortunate respite and gave her time to widen the distance between her and her pursuers. She made judicious use of it, and down the Roanoke she flew, keeping close under the hills and in paths that skirted the low grounds until reaching the Roanoke Mills, some three miles from the break. She here turned due north out from the river a mile and kept up east until parallel with Eaton Perry road, for a while.

A few hundred yards above the "scratch field"—a field sacred to the memory of Cols. Edmonds and Putney—she crossed the road, returning to the Roanoke. Here I headed the pack and had a fair opportunity to enjoy the sport and note positions of each dog. Plunder, a full brother of Brodnax's Ledrow, was in the lead, with little Mischief well contesting his position. The mush had gone, and the whole pack looked drawn for the race. And so they moved. As they passed me, with every individual dog in his place, I was enthused with the scene, put spurs to my horse and dashed through the woods with no feeling of the lagger about me. I had not gone over half a mile when I was abruptly thrown against a tree, backwards from my horse, momentarily stunned, with the blood flowing from my forehead and nose and unable at first to get up. There I remained until the sweet music of my

again on my recease terms try it again.

The result of the chase I cannot give. If there was no interruption of it, the fox soon was either put to earth or killed. It was impossible for him to stand up and escape killed. Apart from this the pack soon returned

interruption of it, the fox soon was either put to earth or killed. It was impossible for him to stand up and escape under the press. Apart from this the pack soon returned home, and pretty much together. Logan was in the advance, and Logan "never surrenders."

How my collision against the free occurred may be a matter of interest to all huntsmen. My horse is a thoroughbred one—very intelligent, easy and quiet in the chase, and perfectly under control of the rein. So he may be pronounced a perfect "hunter," more especially when you add that he is a fine leaper and no blunderer. In riding through woods I usually look some distance in advance, marking the line of my motion. I did so on this occasion. But the woods being very open and free from shrubs, I did not use my customary discretion, and permitted my horse to have his own way up to within a few yards of the tree. I discerned if he went to its right the space between it and another was too small to allow safe passage, I consequently attempted to pull him to its left, and succeeded; but it brought the half of my body and face against the tree, and with a horrible crush of my whole frame. The feeling cannot be described. If I had been a heavy max he result might not have been so favorable. I weigh only 112 pounds in full dress, and the speed of my horse could not have added enough to my momentum to render such a condition fatal. At all events I am still myself.

#### A CAPTIVE WOODCOCK

A CAGED woodcock, now to be seen is this city, is attracting much attention. The bird, which is apparently a male, was captured July 28th by the proprietors of an auction store on Sixth Avenue, into which it had flown, and was afterwards transferred to the hands of Mr. J. Morris, of Jefferson Market, where it is now to be seen. Its present owner, who was formerly a dealer in game, and has a very clear idea of the requirements of a woodcock, has fitted up for his pet a very comforta-ble prison. This, which is an ordinary canary's breeding cage, is covered on the floor with dry moss, except at one end, where there is a box of mud three inches deep, ten wide and eight long. The bird is fed wholly on earth wide and eight long. The bra is ten whonly on each worms, of which he eats each day a great number. They are buried in the box of mud by Mr. Morris, who has great difficulty in keeping the bird away from that end of the cage until the food is covered up. When his master introduces his hand into the cage the bird manifests great excitement, and declines to give up his place on the mud, so that he has to be pushed away to the other end of his quarters. As soon as he is permitted he returns to the box of mud and commenced to bore with the utmost

Stalking over the damp earth with much deliberation. he introduces the extremity of the bill into the mud at an angle of about 80°, and by a series of slow pushes, buries it to the base. While doing this his left foot is advanced and his body slightly inclined downward. When his bill is fairly buried the woodcock stands perfectly still. He

looks as if he were listening, and many of those who have seen him believe that this is what he is doing, but we think that there is no doubt that he waits to feel if there is any movement in the mud. The point of the bill of woodcock, snipe and some other waders, are extremely sensitive, and they can no doubt detect any movement in the soft earth in which the bill is plunged. If the bird then feels no movement he withdraws his bill and repeats the same performance at a little distance. If a worm is felt, however, or the motion which indicates that one is near, he partly withdraws the bill, and changing its direction slightly, plunges it in again, and withdraws the luckless worm, which he then devours, apparently with great satisfaction. This proceeding is repeated until all the worms supplied have been extracted from the mud. He then with great deliberation cleauses his bill by means of his feet, ruffles up all his feathers and gives himself a shake or two, and then retiring to the dry moss at the other end of his cage, buries his long bill among his scapular feathers and prepares for a nap. Slowly his bright brown eyes close, and at last he drops off, to dream, no doubt, of the swamp where he was born, and where he passed his early days.

One of the most remarkable things about the bird was the rapid way in which he sucked in the longest worms His upper and lower mandibles came together very rapidly, and almost before the worm was fairly drawn from his hole he disappeared down the woodccck's throat.

We understand that Mr. Morris is having a larger cage built for Dick, as he calls him, und we hope that in his more ample quarters the latter may live long and hap-

#### DIRECTIONS FOR COLLECTING ALG.A.

BY DANIEL C. EATON, PROFESSOR OF BOTANY IN YALE

THE following notes are printed for the use of those who are willing to help the cause of natural history by making collections of seaweeds and sen-mosses, but are yet uninformed as to the modes of collecting and preparing their specimens,
WHERE, WHEN AND HOW TO COLLECT

WHERE, WHEN AND HOW TO COLLECT.

After a heavy gale blowing on the coast, almost any beach of sea, gulf, or bay, will be covered with algre, often in great quantities, coarse and fine, black, red and green, in entangled masses. Such heaps should be carefully examined as soon as possible after their formation, or else the more delicate kinds will be quickly destroyed by decay.

green, in entangieu masses. Such a presentation of cache fully examined as soon as possible after their formation, or else the more delicate kinds will be quickly destroyed by decay.

At extreme low water the sea will leave tide pools among rocks, or sometimes in the sand, and by wading in these pools many sorts may be obtained. The rockpools with clear water and some shade from the rocks will generally yield the finest specimens. Old buoys, piles, wrecks, etc., afford good nesting places for seaweeds. In quiet weather a small dredge worked from a boat, in water from one to fifteen fathoms deep, will often bring up varieties not to be obtained in any other way. A strong fishing line with coarse hooks will bring them up from the bottom also. A seine left a day or two in the sea, as a pound-net for instance, will catch many algae which were floating in the water.

The collector ought always to have a light hand-net—a bag of mosquito netting stretched on a brass hoop of 8-10 inches diameter, and secured to a good six-foot staff, is very convenient—a light basket containing several quart or pint preserving jars, a few smaller wide-mouth jars, and perhaps a pair of brass forceps and pocket magnilier.

The coarser sorts may be put in the basket, and the finer ones in the jars, keeping the latter filled with clean sea water. It is well to wash each specimen clean when first obtained, so that the collection taken home may be in good order. Very rare or delicate specimens should be taken to get the whole plant if not too large, and if it be very large, to cut out for preservation the root or the plant.

The most extend collector will note also the kind of

be very large, to cut out for preservation the root or "holdiast," and portions of the stem and other parts of the plant.

The most careful collector will note also the kind of place where the plant was obtained, whether on rocks, piles, floating, or growing on coarser varieties.

OF PRESERVING THE COARSER SOUTS,
These should be shaken a little, loosened or spread out a little, but never washed in fresh water, and then dried in the air. The best way is to stretch a cord in some windy, and if convenient, shadly place, and to hang the specimens on the cord. The flat-leaved forms, however, dry to best advantage if spread out on coarse paper and laid on a board. They should be protected from the dew at night, or brought under cover. In this way a day or two will dry almost any sea-weeds, and, as the salt remains in them, they will keep for years, and may be easily soaked out and mounted on paper at any time. This rough-dried collection should be packed in boxes, and if the specimens pack too closely, twigs may be placed among them; if not closely enough, a slight sprinkling will make them so pliable ac to pack nicely. Such seaweeds, however unsightly they may be in this condition, may eventually be made into excellent specimens. Corallines and other stony algo-may be wrapped up in paper, and will keep so indefinitely.

OF MOUNTING THE MORE DELICATE SORTS ON PAPER. Dr. Harvey has so well deacribed this process, that the following description of it is taken from one of his works on alga. "The collector should have at hand a couple of large flat white dishes, filled with [fresh] water, in one of which the specimens may be washed, pruned and freed from parasites, and singly introduced into the other when sufficiently cleaned. When the specimen is floated in the second dish, a piece of white paper of proportionate size is to be introduced under it, the branches finely displayed with a pointed instrument, a porcupine's quill or a small forceps, and the superfluous parts removed. The paper, with the specimen is odisplayed

be carefully withdrawn from the water, placed between two sheets of soft paper, and subjected to pressure like other plants. Thin calico (white muslit) rags are useful to lay immediately over the specimens, between them and the soaked paper, as the cloth is less likely to adhere to their surface than paper, and if it does adhere, is more readily removed without injury. After the first six hours, and again once every day till the specimens are fully dry, the wet paper must be changed, and then it will be found, in most cases, that the specimen has adhered to the white paper on which it was displayed. The smaller kinds will be sufficiently dry in forty-eight hours. A very little practice will make the process casy, and the rouble will be repaid by the beauty and interest of the collections which may soon be formed. To the above it may be added that the firmer red varieties will improve in color for several hours' steeping in fresh water, but many of the most delicate must be mounted from salt water only, else the color, and sometimes even the structure of the plant, will be destroyed. The best, as well as the cheapest kind of press is two good pine boards, about twelve by eighten inches, and half a dozen bricks separately tied up in wrapping paper. Too great a pressure leaves a print of the cloth on the specimen, and renders it also more difficult to revive a fragment for microscopic examination.

For ladies' albums alga are often mounted on fine bristol board or large wedding cards, and some very beautiful specimens are pressed between layers of white flannel—half cotton is best—without the use of either muslin rags or soaking paper.

A solution of one part crystallized carbolic acid, ten parts pure glycerine, and forty parts of water, will preserve algae a long time, and such specimens are even better for study with the microscope than the specimens on paper.

on paper.

It remains only to add that the writer of these notes will receive with thanks any collection, large or small, from all parts of the world, and will endeavor to name all American specimens sent to him.

New Haven, Conn.

A RAT WITH A COLLAR, -Many of our readers will remember that some years ago we published an account of a deer with a bracelet, and gave a wood cut showing the manner in which the unlucky animal "had put his foot in it." The bracelet in this case was a hard ring of wood, the outer portion of a pine knot, and it appeared that the deer while small had stepped into it, and had never been able to free its foot from the incumbrance,

A somewhat similar incident is noticed by the Washington National Republican, as follows :-

ington National Republican, as follows:—

Mr. J. Enthoffer, an employé of the United States Coast Survey, residing at No. 68 1 street Northwest, has contributed a curiosity to the Smithsonian Institution, which, if it adds nothing to scientific knowledge, will be regarded with much interest by all persons interested in the habits, adventures, and misadventures of rats. Mrs. Enthoffer had been annoyed for some time by a persistent rat. She occasionally eaught a glimpse of his ratiship, and was surprised to see that he wore what appeared to be a yellow collar. This fact gave rise to much speculation in the family as to how the rat came into possession of the collar. The mystery was solved a few days ago, when the rat wearing the collar was caught in a trap. Unfortunately the rat was found that the collar was a ring of bone, fitting tightly about the animal's neck. The theory is that the rat when it was small had found a bone, and gnawing out the center, pushed his head through and was unable to extricate himself. As he grew larger the ring of bone tightened about his neck, and he wore it until death as a badge of his enterprise in the search for food.

A TAME RUFFED GROUSE .- Not long since we published an account of a ruffed grouse in Massachussetts, which was so tamethat it would come at its master's call and cat from his hand. Subsequently we received brief accounts of other tame grouse, but most of them lacked definiteness, and were hence of little value. From the Dansville (N. Y.) Advertiser we take the following note, which is, if true, very interesting. We give the item in

full:—
Charley Sedgwick tells us of a tame partridge which he has seen and handled, the like of which we have never before heard. While in Mt. Morris last week Mr. Sedgwick heard about this bird, and was only too glad to accept an invitation of Capt. McCarther to visit it. It is found on Mr. Sweet's farm below Mt. Morris, about a mile, and lives alone in a brush pile near some farm buildings. To induce this bird to emerge from its hiding place, all that is necessary is to pound on the building, when it will cautionsly come forth, and after a short time permit you to pick it up and handle it. You can toss it into the air and it will fly in a circle about you and finally alight at your feet. It seems that some workmen first discovered the bird while eating their dinners near its cover. When first seen it was not yetfull-grown and apparently "alone in the world." The workmen by feeding it day after day gradually overcame its extreme shyness and brought it to its present state of tameness.

TEMPERATURE OF FRESH WATER LAKES .- Some inter-

TEMPERATURE OF FRESH WATER LAKES.—Some interesting results have recently been published in the Archives des Sciences by Prof. Ford bearing on the temperature of certain fresh water lakes.

From experiments conducted at Lake Leman, it appears that the hundred meters nearest the surface absorb the beat very rapidly, but it penetrates the lower depths much more slowly. At a depth of 335 meters there was considerable variability in temperature, and it was evident that the point where variation ceases was far below this depth. The investigator considers that by January 13th, 1889, Lake Leman had expended all the heat stored up in its waters during the previous summer.

ENLIGHTENED LIBERALLY. - 100 sum of 50,000 francs has been appropriated by the French Government to assist Mr. Pasteur in carrying out his investigation on the contagious diseases of animals

THE INTERNATIONAL FISHERY EXHIBITION IN BERLIN.

RUSSIA, ENGLAND AND AMERICA, N

[From Vol. III., No. 27, of the "Deutsche Fischerei-Zeitung," Stettin, June 15th, 1890.7

LYSSIA'S exhibit in the Berlin Fishery Exposition of 1880 is by no means proportionate to the wast extent of her system of watercourses, to the products of her enormous rivers and her colossal lakes. These watercourses have rendered the steppes habitable and have made them fertile by their moist atmosphere drawing immigrants to their shores. The wealth of fish called into existence a sort of primitive bartering trade extending far induals the monats became farmers and fishermen, and the total of the rivers, whose existence is in part at least based on the fisherics. The Volga, the Don, the Dnieper, the Obi, contoin nearly all our well-known species of fish, but especially an enormous supply of sturgeon, which in spito of persecutions yield a rich fish larvest year after year. Of all this, and especially of the immense economical importance of the Russian fisherest in the state of the spitological properties of o

of St. Lawrence to the Gulf of Mexico, a distance of

of St. Lawrence to the Gulf of Mexico, a distance of 2,500 miles.

We also find here models of all those vessels which are used for fishing on the high seas and for transporting live fish. Amongst the rest there is a model of the United States steamer Fish Hawk, which is exclusively devoted to the service of the United States Fish Commission, and is furnished with all he necessary apparatus for hatching codfish and shad during the voyage. In this we also recognize the practical method of our transatlantic cousins, of whom it may be said in the best sense of the term, "that they know how to do it." To conceive a good idea and to carry it out, is with them one and the same thing, but what a long distance does often separate the two with us! To give an idea of the care which has been taken to make every portion of the exhibit as complete as possible, we will mention that twenty-four different kinds of knives are exhibited, all serving some special purpose in connection with the fisheries. From the primitive implements used by the Iudians down to the most modern and ingenious contrivances, no intermediate stage is left unrepresented. We see whole walls covered with every imaginable variety of hooks and of artificial baits, mostly flies; there are about 400 kinds. In one word, everything we see combines solidity and elegance, is so well made and so advantageously exhibited, that even a perfect tyro in the noble art of fishing will soon understand the use to which each object is to be put. There is no gap in the representation of the vast field of the fisheries and of the history of pisciculture, and the impression which this exhibit makes on the visitor is therefore powerful and hasting. Time forbids to mention more details, although the rich exhibit of works on the subject might well deserve it, and we leave the exposition deeply impressed with the energetic, well-directed and successful activity of the United States Fish Commissien.

HATCHING THE LOPHIUS. - Last week our Gloucester correspondent gave an account of the hatching of the "American angler," or "goose fish" (Lophius americanus), by Mr. A. H. Clark, and we naturally wanted more particulars concerning the obtaining of the eggs, time of hatching, etc. He writes as follows:

more particulars concerning the obtaining of the eggs, time of hatching, etc. He writes as follows:

GLOCESTER, Mass., Ang. 4th.

The eggs were found floating near the surface in a string some thirty feet or more in length and several feet wide, held together by the glutinous or jelly-like substance before mentioned, and not attached to any weeds or drift stuff. A part of them were placed in the "Chester Hatching-box," which was moored alongside the wharf, on the 15th of July. On the 19th the eggs were separated, and the embryo could be seen in them. Three days later fish were found alive, with the umbilical bag attached, and on the 27th the bag was found to be absorbed on some of the young fish. Judging from this, it would be five days from the time of hatching till the fish were fully formed. We know how worthless the "monkfish" is in a "practical point of view;" but still, not-withstanding he is principally noted for nothing better than a natural aptitude for "taking in" all he can, with a rapaciousness that might stamp him as a Jew among fishes, it cannot be denied that he has a fine open countenance, which is certainly a recommendation; for, when he smiles. The upper part of his head is on an island, and it is an invitation to all little fishes to come in out of the wet.

DENTLOF MR. W. A. LLOYD —We regret to announce.

DEATH OF MR. W. A. LLOYD.—We regret to announce the death of Mr. W. A. Lloyd, so long and favorably known in connection with European Aquaria. He died in England July 11th, at the age of 56 years. He planned most of the public aquaria in England and on the Continent, and was probably the best informed man upon the management of them in the world.

THE "FISH HAWK,"—The United States fish-hatching steamer Fish Hawk arrived at Newport on the first of this month, and on the sixth made her first official trip with all the members of the Fish Commission on board exept Prof. Baird.

cept Prof. Baird.

Codfish in Fresh Water.—In a translation of Forteguels over de Danske Ferskvandsfiske. Ved Arthur Feddersen. Naturhistorisk Tidsskrift 3. R. 12. B. 1-2. H. 1870, by Dr. T. H. Bean, of Smithsonian, the following passage occurs: The catalogue below quoted includes strictly fresh water fishes only, and such marine fishes as are frequently found in fresh water. I have, however, been somewhat perplexed by a couple of species, which are stated by C. E. Varning, a merchant of Kolding, to be caught now and then in Kolding rivulet, namely Torsk (Gadus morrhau), which in September and October is caught in abundance, and Tangsnar (Spinachia vulgaris). Indeed, in the rivulet mentioned my countryman has even himself caught or seen caught the common kulmule (Merluccius vulgaris) and pighaien Meanthias vulgaris) which are not found elsewhere on the coast. The Torsk is said of late years to go quite up to the basin at Odense; in the rivulet, however, it ascends scarcely beyond Korup." Why not have the codfish in the great lakes?

lakes?

J. A New Species of Mackerel.—Gloucester, Mass., lug. 9th.—A peculiar fish, somewhat resembling a mackerel, and about twelve inches long, was found among some mackerel that were caught in a seine seven miles southcast from this harbor on July 26th. Mr. John Conley presented it to Mr. A. Howard Clark, Agent of the United States Fish Commission here. Old fishermen who saw it thought it a hybrid. The fish was forwarded to the headquarters of the Commission at Newport, where it was examined by Profs. Spencer F. Baird and G. Browne Goode. At first it was thought to be a species of Anxis, a fish said by Prof. Baird to resemble the tunny in form, and also having a corslet of scales around the pectoral fin as the tunny has. The Anxis has been taken in large quantities on the coast, but they are worthless as food. A later and more thorough examination of the fish has been made by Prof. Goode, who now thinks it may be an entirely new species of the true mackerel family, heretofore unknown to science. The fish resembles the common mackerel (Scomber scombru) in shape, being, possibly, a little thicker, is blue on the sides and back, and without the transverse markings peculiar to the mackerel.

ANOTHER NEW FISH ON THE ATLANTIC COAST.—Newport, R. I., Aug. 4th.—The United States Fish Commission has obtained numerous specimens of a fish, before entirely unknown in the Western Atlantic. This is the frigate mackerel, Aucus rocheit, twenty-eight borrels of which were taken in a mackerel seine, ten miles east of Block Island on the 3d of August by the schooner "American Eagle," Capt Josiah Chase, of Provincetown, Mass.

east of Block Island on the 3d of August by the schooner "American Eagle," Capt Josiah Chase, of Provincetown, Mass.

The frigate muckerel resembles in some particulars the common mackerel: in others the bonito, the genus Aravis being intermediate in its character between the scomber, and the related genera Pelomys and Oregans. It has the two dorsal fins remote from each other as in scomber, and the general form of the body is slender; like that of the mackerel. The body is, however, somewhat stouter, and instead of being covered with small scales of uniform size, has a corselet of larger scales under and behind the pectoral fins. Instead of the two small keels upon e.eh side of the tail which are so noticeable in the mackerel, it has the single more prominent keel of the bonito and the tunny. Its color is grayish-blue, something like that of the pollack, the belly being lighter than the back. Under the posterior part of the body, above the lateral line, are a few cloudings of maculations resembling those of the mackerel. The occurrence of a large school of this beautiful species in our waters is very noteworthy, for the fish now for the first time observed are very possibly the precursors of numerous schools yet to follow. It is not many years since the bonito became an inhabitant of our waters, and the distribution and habits of the frigate mackerel are supposed to be very similar to those of the bonito and the little tunny, which also first came on the coast in 1871, and have since been found in considerable numbers.

The frigate mackerel has been observed in the West Indies and other parts of the tropical Atlantic as well as on the coast of Europe. In Great Britain it is called the plain bonito. It is not unusual in the Bernudus, where it is called the "trigate mackerel," a name not inappropriate for adoption in this country since its general appearance is more like that of the mackerel appears to be inferior to the bonito.

G. Brown Goods.

In a late note Mr. Goode tells us that the auxis appear to be very

In a late note Mr. Goode tells us that the auxis appear to be very plenty off Block Island, one vessel coming into Newport which had caught and thrown away four hundred barrels of them. Our Newport corre spondent, "Occasional," sends us a specimen of the lish, which is so fat that we should think it valuable for oil, if not for the table. We should have tested its merits as a food fish, had the letter describing it come earlier.

TROTTISG IN NORTHERN MICHIGAN.—Jackson, Mich., July 28th.—I have pleasure in sending a memorandum of a recent experience away up in Northern Michigan.

A party of four left Jackson June 15th; ticket to Treverse City and return, fare \$9.50; arrive at Traverse City 3 a.M., 16th; a thriving little city at the foot of Traverse Bay; had an elegant breakfast at Park Hotel—lake trout, etc., etc. At 8 o'clock left on board of the steamer City of Grand Rapids and made landings at Old Mission, Elk Rapids and Torot Lake, where we arrived at 2 o'clock; steamboat fare, \$1. Went directly to the Lewis House, a large, pleasant hotel; rooms for about fifty people, with all the accompaniments for hunting and fishing, boats, etc.; charges, \$10 per week. A couple of our party went out after a 3 o'clock dinner and brought in seventy pigeons; remained here one night and the next morning took a team for Cedar River in Bellair Township, the county seat of Antirin County; distance by wagon road, eighteen miles, and by steamer across Forch Lake, twelve miles. The steamer was towing rafts and not to be depended upon that day, so we took the team around, arriving upon the Cedar River about \$1.50. County and the next must be promised to the steamer was towing rafts and not to be depended upon that day, so we took the team around, arriving upon the Cedar River about \$1.50. County and the next handle from its junction with the intermediate river which runs into Grass Lake, haff a mile below the junction, and, having speedily pitched our tent, prepared our hand of cedar boughs and lighted our camp fire, our first meat was soon ready and disposed of; our pipes of peace smoked, and we turned in for a snooze after; a few short years. A state of the state of the carly bird, two of us went down and two worked up stream. The Cedar is a splendid little river about eighty feet wide on an average, and four feet deep, with the usual deep holes and shallow rapids

which we uncarthed, in his communication. Ilterary....
On the 24th, early morning, we struck tent, packed out traps, paid off our man \$1 a day, hired a team for \$4, and at 6 P.M. were landed across the country on the Grand Rapids and Indiana Railroad at Mancelona Station; took train at about 10 P.M.; arrived at Grand Rapids at 5 A.M., and at Jackson at 9:30 A.M., with a nice lot of trout packed in sawdust, which we got at a mill at Grass Lake, and which were as nice and hard as though just from the water, almost, and no loss of flesh or appetite after our six days among the brook trout of Cedar River.

or appetite after our six days among the brook trote of Cedar River. We unanimously voted the trip a success, and that fu-ture years would find us, with rod and fly, trying for a fly. Louiz.

TROUT IN NORTH CAROLINA.—Sharon Will, Aug. 3d.—In your paper of July 29th, your correspondent, "A. F. J.," inquires if there are any trout in the French Broad River in North Carolina; and in continuation of the subject, you ask for information about the distribution of trout in that State. There are very few trout in North Carolina, in the streams that flow east into the Atlantic Ocean; but nearly all the streams that flow east, into the Tennessee River, contain them, often in great abundance. I have never seen them there in waters less than 2,000 feet above the sea. They are seldom found in large rivers, such as the French Broad, but they prefer the-tributaries, and "push up" well toward their sources. They like to revel in the cool, shady waters, fresh from the carth, above the settlements where the tree and bushes are cut from the margins of the streams, and where foul waters are carried from plowed fields in times of rain.

of rain.

I will enumerate some of the streams in North Caro-I will enumerate some of the streams in North Caro-lina where trout may be found, commencing in Watauga County and going southwest. When I mention a river, I mean its tributaries. Trout are found in the Watauga River, in the county of the same name; in Mitchel County, they exist in North and South Toe Rivers; in Cane River, in Yancey County; in the headwaters of the French Broad, in Henderson and Transylvania counties; Cane River, in Yancey County; in the headwaters of the French Broad, in Henderson and Transylvania counties; and in its tributaries, such as the Swannanoa and Ivy rivers, in Buncombe County; in the Big Flegon River, in Haywood County; in Tuckaseege River, in Jackson County; in the Little Tennessee River, in Macon County, especially in Sugartown Creek, above the falls, where the good old Sikas McDowel "planted" them many years ago, as he informed me, and where they may be caught among the clouds, nearly 4,000 feet above the sea, probably the highest habitat of the trout in the United States east of the Mississippi River. Probably the best fishing may be obtained in the Nanthaleh River, in Macon County, especially in Buck Creek, on "Chunkey Gal Mountain." This river is 2,600 feet above the sea, near Alec, Monday's house, on the main road from Asherville to Ducktown and Cleaveland, Tenn. Alec, can accommodate strangers comfortably, and can give them a bear hunt, also, as he is a fearless hunter and keeps good dogs. His address is Aquone, Macon County, N. C.

I could never ascertain whether trout are found in streams farther south than the Nantabaleh River.

They are not found in the Hiwassee, and there are contradictory reports about their existence in the headwaters of the Oconce River, in the mountains of Georgia. There is a railroad now from Salisbury to Asheville, among the mountains of North Carolina. When going to Mitchel or Yancey counties, one should leave the railroad at Marion, and re to Bernal Little and the read-

There is a raironal now from Salisbury to Asheville, aniong the monutatins of North Carolina. When going to Mitchel or Yancey counties, one should leave the railroad at Marion, and go to Burnsville, or stop with Isaac English on the way. Tom Wilson is the "boss trout fisher" in Yancey County, and can entertain strangers. His address is "Big Tom Wilson," Burnsville, Yancey County, N. C.

Do not neglect to put in the "big," as he says he does not wish another, but smaller Tom Wilson to get his letters. Tom says he can eatch trout at alt times and seasons. I have seen him catch them at night, when he made a large fire near the stream "to light fen up." He says the big fish bite best at night. The people among the mountains of North Carolina are very kind and hospitable. I will mention the names of some other persons there who will give in formation about fishing localities At Asheville, Gen. Clinguan and E. J. Aston. At Waynesville, Judge Gadger studies practical ichthyology as well as law, and if not engaged on the Circuit, he might be disposed to exchange his gavel for the lip rod. At Franklin, in Macon County, Mr. Jackson Johnson and Rev. C. D. Smith will cheerfully give information to strangers. No one who visits Mitchel County should fail to go to the top of Roan Mountain, where Mr. L. B. Searle cutertains travelers at his house among the clouds 6,370 feet above the sea, and where one may see a cheerful, blazing fire every norning and evening in summer. His address is Cloudland, Mitchel County, N. C.

STROUDBRUERG, Pat., Ann. 4th.—In answert to the inquiry.

STROUDSBURG, P.L., Ang. 4th.—In answer to the inquiry of "A. F. J." as to whether there are trout in the French Broad, I will say that I spent hast summer between Hendersonville and Brevard, late county seat of Transylvania County, and was repeatedly told there were no trout in the French Broad, that stream having only a few black bass and more "jack," But in the upper waters of thilk River and Davidson River, and other tributaries of the French Broad trout may be caught, though that are to the French Broad trout may be caught, though they are not very plenty, as in the neighborhood in which I staid I was told that nets were used wherever it was possible. In most of the small streams that empty into the upper French Broad, trout may be found in limited numbers, but are only caught with the worm. No fly lishing on account of the laurel. I tried the fly in Mills River—a beautiful stream—but had no rise; the trout took worms, however, readily. This river can only be whipped by wading from ankle deep to waist, and I diln't care to get frozen for the privilege. I was with a party, two of whom were mountaineers and accustomed to wading it cold water. These two, on the last morning of our trip to the headwaters of Mills River and Mit. Plagath, one of the lottiest peaks in North Carolina, began to fish down the river early in the morning, and before they lad gone a balf mile were compelled to leave the water and thaw out, their hands being so numb they could not bait a hook, I did not want trout bad enough to

for that. This was in late August. What the lower waters of the French Broad and tributaries afford I can't say, as I have never been there.

The Lakes in Southean Canada,—Canton, St. Lawrence County, N. Y., Aug. 2d.—In your answers to correspondents, E. M., of New York, asks for directions to reach some retired lakes in the southern part of Canada, like Charleston Lake.

Your location of Charleston Lake is very accurate. You

like Charleston Lake.

Your Jocation of Charleston Lake is very accurate. You are also right about the chain of lakes north of it, but you fail to tell him how to reach them.

For the benefit of sportsmen, I will supply the required data; having been there from three different directions, I perhaps can give it as well as any. If a man Las a bout of his own and wishes to take it with him, to reach there from New York City, or the central part of the State, his best plan will be to take cars to Cape Vincent, thence by steamer to Ganannorqua, put his boat in Gananocqua River and row up it about ten miles, when he will reach the first lake consisting of a chain of seven as beautful lakes as a man would wish to see. He will also find a number of ponds scattered around among the hedges and mountains, consisting of what the inhabitants call Lime Lake, Long Lake, South Lake, Hugdy Lake, Kindrick Lake, and a number of others without names, with good lishing in all of them and excellent black bass fishing in most of them. I had the pleasure of spending a few days there last October, and found the fishing all that one could desire in the shape of small fishing; have taken bass from Leadmine Lake that weighed eight pounds, and gamy enough to satisfy the desire of any sportsman.

If a man has no boat and wishes to go light, let him. any sportsman.

If a man has no boat and wishes to go light, let him

If a man has no boat and wishes to go light, let him take cars to Ogdensburgh, cross over to Prescott, take the Grand Trunk Raifroad to Lensdown Station, hire a team to take him to Henry Slack's, at Post Bay, and inquire for John Slack, who has in his possession one of Rushton's boats, and is an excellent guide, and will give you more fishing and fun in two weeks than a man can get at Saratoga in two months. These lakes and ponds are all within easy access of one another, and a good strong man can carry his boat from one to the other without any trouble, and by carting his dufel four miles he can reach Charleston Lake, where he will find good sahuon-trout fishing, and scenery which any lover of nature can not help but admire.

J. C. salmon trout fishing, and scene nature can not help but admire

Another correspondent writes from Toronto, Aug. 4th: One of your correspondents asks where he can have some good black bass fishing. Send him to Lake Joseph, north of Toronto. He must take worms for bait, as all land there is rock, and does not contain worms.

RECOVERED HOOKS.—Janesville, Wis., July 28th.—In RECOVERED HOORS.—Janesville, Wis., July 28th.—In your issue of July 15th I see an article about a recovered hook, in which the writer says that he caught a fine trout weighing one pound, with his missing hook in its stomach. On July 22d, inst., two of our fishermen went to Indian Fork dam, ten miles up the river from here, and one of them caught a fine pike that weighed four pounds, and when caught it had a set of triple hooks and about two inches of silver gimp in his mouth. He was hooked in both the upper and lower jaw, and one of the hooks was broken off at the beard of the third hook. He had a lively time with him, as it was in very swift water and with a light rod. How long these hooks had been in his mouth he did not know, but he said they been in his mouth he did not know. were very rusty.

ANOTHER RECOVERED HOOK.—Franklin, Tenn., July 24th.—Your paper of July 15th contains an account of a "recovered hook," after remaining in the mouth of a trout for nineteen days. A somewhat similar experience occurred to me in the mouth of May last, on the waters of Bestlord Lake. In November, of last year, I was fishing near Carpenter's Landing, and after a strike lost my hook (a No. 8 barbless) by the breaking of my line, and in May of the present year, while fishing near the same place, my son, who was fishing a few yards from mecaught a black bass with a barbless No. 8 hook fastened through the lower jaw. About a quarter of an inch of the point was lost, and in several places the rust had nearly destroyed the wire, so that in a short time the hook would have been released. The bass was in good condition, and did not seem to have suffered from the presence of the foreign body. As I was the only person on the lake using the barbless hook, I presume there can be no question raised as to its identity, and consequently as to the time it was carried by the fish.

Bedford Lake abounds in all the fish known to Western waters, and the number of logs, sunken stumps and characteristics of the bottom, make it impossible for those who fish for profit to exterminate them or ever seriously dimnish their numbers.

Bass Fishing in Sullavas County,—Narrowsburgh, Sullivan County, N. Y., Aug. 4th.—To-day has been an eventful one in the history of this place, for the visiting as well as the native resident fisherman. A Philadelphian signified his intention, by telegram to the Messrs, C. H. & C. J. Murray, the proprietors of the principal hotel, to visit them, coming prepared to eatch bass, as he had read a letter in your paper relative to the splendid bias fishing at this place. I will mention at this point that considerable surprise has been manifested at the circulation of your paper; visitors from different sections of the country have visited us to try our fishing grounds from the reading of the article referred to.

Mr. Middleton was attended by the famous Delaware River fisherman, Dell Bedford, Esg., a heroules in physical proportion, and of a genial disposition. The different points of fishing ground were patiently fished, the clipper bait being used successfully: to-night Mr. Middleton congratulates himself on being the possessor of forty-eight bass, few weighing less than two pounds. The Narrowburgians also were fortunate in capturing bass: eight boats with two or three occupants in each made up the fleat. This day has been a remarkable fishy day. Mr. J. B. Goe, of the Court of Common Pleas, is stopping here, and he has been considered heretofore the champion fisherman, but to-day his flag is bowered, he having surrendered. The gentlemen of the Graphic, Messrs, Goodsells, have been with us and were successful; their piscatorial outfit was magnificent and it has been the cheft topic of conversation; also the graceful manner in which

they manipulated the rod and line, both gentlemen standing erect in the boat with fly rod in hand, stop reel, etc. Occasionally a fly as an experimenter would be cast to the game, then a grasshopper, next a pure gold spoon, trolling, last the ordinary sliny ground worm. The picture was fully up to the Graphic's best. Fifty pounds of bass were taken by them, which were packed in grass and ice and sent away. So much for your article signed "Willoughby." Come and see us, and invite your friends. You will find it no hoax about our bass flabing.

Northern Michigan, and a stay of two weeks at Charlevolix; have not much to relate in way of adventure, though they have a great deal to say of their infaltation with that region, which is becoming every year more popular as a summer resort, and of the fishing, which they enjoyed exceedingly. On their way from Chicago up the lake, by steamer, two or three of them disembarked and tried their luck in Black Lake, about ten miles south of Grand Haven. This lake stretches from Holland, west-ward, to within a few rods of Lake Michigan. You can stand between the two and throw a stone in either. Their waters have been made to unite by an artificial channel, the work of the government, so that vessels might run in there in times of storm and be safe. About ten years ago a lighthouse was erected at this point. Here they found excellent bass fishing. Now and then a maskalongs is captured in this lake. This piece of good fortune, however, did not fall to our boys. Spending several days there they took the train North for Petoskey, on Little Traverse Bay, and thence by boat to Charlevoix, on Pine Lake, into which "The Boyne" empties, which is reckoned the best of all the many trout streams thereabout. They speak in glowing terms of the sport they had there thouting. The Irout averaged well; once in a while an unusually fine one would be taken. While they were there, Rev. Mr. Goodwin, of Chicago, took on a fly one that weighed two and a half pounds, the champion of the season, so far. Good for the cloth. In course of time I trust that I shall have some personal experience in this delightful region to tell about.

SALMON ANGLING IN CALIFORNIA .- The anglers of San

Salmon Angling in California.—The anglers of San Francisco have a new field open to them for salmon angling. The Bulletin, of that city, says:—
"For several years past the fishermen in Monterey Bay have taken a few salmon on their lines each summer, while trolling for barracouta and other surface fish. Within the past week, however, salmon bave been so numerous that a great many have been taken with trolling lines, and the guests of the Hotel del Monte, at Monterey, have had rare sport in supplementing the professional dishermen. The fish taken have been in some instances of large size, and doubtless are a portion of the late summer run of salmon en route to the spawning grounds of the McCloud and other brauches of the

instances of large size, and doubtless are a portion of the late summer run of salmon en route to the spawing grounds of the McCloud and other branches of the Sacramento River.

"From a telegram received, it is ascertained there were four boats out yesterday, the united catch being fifty salmon, the largest weighing twenty pounds, "As salmon do not frequent the coast streams in summer, it follows that the discovery of an abundance of them off Monterey at this season of the year is proof that they go south instead of north of this port, as has heretofore been believed, between their spawing seasons. From A. C. Tubbs, who has returned to this city, it is ascertained that an examination of the stomachs of the salmon taken showed their food to be toniced or frost fish, instead of smelts, sardines, anchovies and other surface small fish, as has hitherto been supposed. "The discovery of salmon at Monterey opens a new fishing field to the people of this city, who will be able to indulge in the sport at less expense and discomfort than is the case with residents of Eastern cities, where the nearest salmon rivers are in Canada, and quite difficult of access."

the herress samon rivers are in Canada, and quite difficult of access."

\*\*X Crappie and California Salmon.—St. Paul, Minn.—I have been long wanting a paper that occupies the place that your journal does. There are many men who are by nature sportsmen, but who from lack of means and time cannot from experience become posted, and to this class your paper becomes invaluable; men who now and then have opportunity for a few days' fishing and shooting and who do not like to go into the field entirely unprepared. I have never cast a fly before this season, and though I cannot claim any degree of excellence or grace, still have managed to get several strings of very handsome bass. Will some of your readers kindly give no information, as to what buit to use and how to fish for California land-locked salmon? There is a lake near my place in the central part of the State that was planted about five years ago, and the farmer living there has caught five or six while bait fishing for bass, quite good sized. I am going up there for a day or two and would like to try my luck. Will they bite on a hy? And will you also please give me information concerning the fish called in the Western States the "croppic." I have never seen them elsewhere; they are shaped like a sunlish, but different color, and excellent table lish, though not very gauty. I have never found any one who could tell me to which class they belong,

The California salmon should be left to breed. The California salmon should be left to breed

The "croppie," or "crappie," is Pomowys nigromacu-

Idans.

How to Pack A Salmon,—The best way, says Mr, Burkland, the well-known English naturalist, to pack a salmon to send away is to cover him completely with silver paper, giving him, as it were, a new skin. The silver paper will adhere by means of the natural sline. The fish should then be placed in a box and buried in clean sawdist. When the silver paper is wished off with a sponge it will be found that the beautiful tints of the fish are better preserved by this mode of packing than by any other. Salmon, as Mr. Buckland points out, are without doubt at their best when caught actually in the sea. They are then full of "curd." This will disappear, and the fish become linn it placed in ice for a journey. Those, therefore, who wish to send away a tresh-caught salmon in its prime, should put the fish into water actually on the boil for five or ten minutes before packing it. Boiling water instantly consolidates the

albumen— $i.\ e.$ , the curd. The boiling process must of course be completed when the fish is to be eaten.

SALMON IN MAINE TAKE THE FLY.—It has been said SALMON IN MANYE TAKE THE FLY.—It has been said that while salmon in most other waters take the fly at some seasons, those in Maine streams have persistently refused it. It would be very gratifying to know why they have declined it, and still more so to learn their reasons for reconsidering the question and resolving to accept it. In proof that they now take the manufactured insect, we publish the following dispatch which reasons for reconsidering the question and resolving to accept it. In proof that they now take the manufactured insect, we publish the following dispatch which was received at Portland from Bangor one day last week: "J. F. Leavitt and H. L. Leonard, 'the rod man,' have just returned from a trip and have brought with them the first salmon taken with a fly in Penobscot waters. This they took in Wassattiquois stream, which empties into the east branch of the Penobscot half a mile above the Hunt farm. They report that plenty more can be had in the same way."

had in the same way."

FISH IN MARKEL—New York has been poorly supplied with fish during the last week. There are a few very large sheepshead coming in from the south coast of New Jersey, which will weigh from ten to thirten pounds. Bluefish and weakfish are small, many of the former being under two pounds; kingfish very scarce, Fulton Market prices Aug. 10th, are: Salt water fish—striped bass, 25 cts. per peund; bluefish, 10; salmon, 45; mackerel, 18; weakfish, 10; Sparish mackerel, 40; halibut, 18; haddock, 6; codfish, 8; blackfish, 124; flounders, 10; pordies, 10; see bass, 18; este, 18; sheepshead, 25; pompano, 75; smoked salmon, 20, dry cod, 7; green turtle, 15; blosters, 10; soft crabs, 75 to \$1.25 per dozen. Fresh water fish—whitefish, 12; lake trout, 15; frogs, 15; crawish, 3.

SAIMON AND SEA-TRUIT ANGLING IN CANADA.—The sport has been very poor on most rivers this season. A gentleman who spent some time on the Restigonche, Nepissiguit and Miramichi rivers reports the season backward and fish scarce. He spent sixteen days on the latter river, by invitation of the lessee, and took many sea trout (Salmo fontimelis), some of them over seven pounds in weight.

A FISH THAT SWALLOWS BIGGER ONES. -The Smith A FISH THAT SWALLOWS BIGGER ONES.—The Smithsonian Institution has received a very curious specimen of the fish kind, recently found on the fishing-banks of Gloucester, Mass., by Mr. A. Howard Clarke. It rejoices in the name of Chasmades niger, and its peculiar distinguishing feature is the fact that its rapacity leads it to swallow fishes which are twice as large and weigh four times as much as itself.

Graving in New Brusswick.—We are informed by Dr. A. Ferber, of New York City, who has just returned from the salmon streams of that region, that he saw veritable grayling taken from Lock Lomond, twelve miles up the St. Johns, where the guides told him that he would find two kinds of trout, red and white; the "white trout" were pronounced to be grayling (Thymallus) by the doctor, who is familiar with them.

How do you put a Crawfish on a Hook. How do you pet a Crawfish on a Hook.—A subscriber writes: Can you obtain from some of your readers, who are black bass anglers, information as to the proper method of placing a crawfish on the hook to be used for bait? We therefore insert this to draw out all the knowledge on this subject that our bass fishers have, in preference to giving our own practice.

LEASE OF ROMANKILL CREEK.—We understand that Messrs. H. Fuller, of the Erie Railroad, and E. Cahill have leased the fishing in three-quarters of the Romanskill Creek, near Milford, Pike County, Pa., for five years, The lessees propose to put in 3,000 trout this fall,

MENHADEN FISHERGES FAIL AGAIN.—A Boothbay, Maine, correspondent of the Lewiston Journal says: "Fish are very plentiful along shore; most every one who can man dory is after them. The menhaden fishery is again a dead failure; the steamers have all gone. South and the factories closed up for the season."

BLUE FISHING EXTRAORDINARY.—Mr. Harry Fuller, of the Eric Railroad, during seven days' fishing at Great South Bay, near Bay Shore, L. I., caught with a rod and reel, no less than 671 bluefish.

Iowa.—Dubuque, Aug. 4th.—Black and white bass fishing is the best known for years, but will not last long, as the river is going down and the sloughs drying up.

JULIEN.

—A "boom" in menhaden or mossbunker oil is reported from New Bedford. The Standard of that city says: "The sales will aggregate about 9.500 barrels, the greater part of which was at 40 cents, and the remainder upon part of which was a terms not disclosed.

### NEW PUBLICATIONS.

THE NUTTALL BULLETIN.—The July number of the Bulletin contains a great amount of valuable information from the peas of a number of our best known ornithologists. A notice of Dr. Stuffeldt's memoir on the "Osteology of Spoulgo cunticular in project," by Dr. Coues, which opens the number, is illustrated by three beautiful lithographic plates. Mr. Ridgway contributes to this number three articles of importance, one on "Rallus longities tris and its Geographical Races," another on "Macrorhamphos grissea and M. scolopaccus" und a third on "New Alaskan Sandhiese. tris and its Geographical indees, another on "New Alaskan Sandbiperseas and M. scolopactus" und a third on "New Alaskan Sandbiper (Arvinatelle concest, Ridgway)." Mr. Dalgleish continues his "List of Occurrences of North American Birds in Europe," and Mr. N. T. Lawrence contributes a paper on "The Greatre Long-beak (Macrorhamphius scolopactus)." There are three papers by Mr. Allen Lawrence contributes a paper on "The Greater Long-beak (Ma-crorhamphia sodispaceus)." There are three papers by Mr. Allen In the July Bulletin. "Destruction of Birds by Lighthouses" gives the results of inquiries by Mr. Deene among the lighthouse keepers of the coast, a class of men who have rare gyportunities for observing the passage of birds during the migrations in spring and fall. Another important paper by the same writer treats of that much agitated question, the "Origin of the Instinct of Migration in Birds," and contains much that is now as applied to our birds. A "List of the Birds of Santa Lucla, West Ingles," complete Mr. Allen's contributions to the last Bulletin. "Recent Literature" notices a number of valuable contributions to North Literature" notices a number of visuality contributions of American and European emittological literature, and "General Notes" contain a vast amount of dews items which will interest every ornithologist.

#### MIGRATORY QUAIL IN MAINE.

PORTLAND And 3d

Editor Forest and Stream:— PORTLAND, Ang 3d. Of 5,100 quali (Coturnia communis) imported to America this year, 2,600 came to Maine and arrived to my care in Portland June 9th. There birds were immediately forwarded to the various parks of the State, where they were liberated in lots varying from fifteen to seventy-five each. For the information of your readers in Maine I give a list of the cities and towns to which I for

warded birds,
St. Stephen, N. B. (adjoining Calais, Maine), Baugor,
Winterport, Rockland, Wiscasset, Bath, Angusta, Richnond, Bowdoinham, Brunswick, Lewiston, Auburn,
Norway, Bridgton, Saco, Kennebunk and vicinity of
Portland.

I made a public request that reports be sent to me of I made a public request that reports be sent to me of their nesting, etc., number of eggs or young observed, localities of nests, where last seen in autumn, and arriv-als here next season from their Southern migration, and any other items of interest. I have received reports from yarious localities, and hope to receive more and fuller ones later in the season.

ones later in the season.

The birds were observed to commence nesting within two days after liberation, and many nests with eggs were reported before July 1st. Two weeks or more later the young were hatched in those nests that had been undisturbed. From ten to fifteen eggs is a usual more liberation. the young were hatched in those nests that had been undisturbed. From ten to fifteen eggs is a usual number to a nest, and eighteen the highest number yet reported. Some nests foundearly, containing only a portion of the number of eggs to be laid, were deserted after laving been mowed over and left exposed. Had such nests been screened by standing grass, or low bushes, probably the birds would not have deserted them. After the full quota of eggs are laid and the birds are setting, there is less danger of desertion. Indeed, these quali have been so devoted to their domestic duties as to permit the noisy mowing machines to kill them on the nests, the knives decapitating them, or the wheels crushing them. The birds that deserted their exposed nests are laying a full number of eggs, having probably nested again, and may bring forth late broods. Although the mowing machines have destroyed a few birds and nests, the worst

birds that descreted their exposed ness are exposed number of eggs, having probably nested again, and may bring forth late broods. Although the mowing machines have destroyed a few birds and nests, the worst enemy of the quail here is the domestic cat. I learn of very many quail having fallen a prey to cats. If our farmers appreciated the injury they suffer by the loss of the many hundreds of insect-eating birds killed by cats every summer, they would take steps to prevent it. All through the spring and summer puss is hunting in the fields and along the hedges; not for mice, but for its more delicate and favorite food, the birds. And a single cat will kill scores of birds, old and young, in a season. Woodcock are not infrequently caught by cats, and our new game, the quail, are suffering great decimation, along with our smaller birds, from this cause.

The quail are very gentle, and not only nest within a few rods of houses and highways, but are observed feeding with the domestic chickens. The farmers take quite as much interest in these quail as do the sportsmen, and many have already learned to know the ventriloquial notes, that can be heard so far away.

Now, while writing of the quail (Columic communis), I wish to protest against subjecting this bird to the application of local names and misnomers. We have enough of confusion in the names of our birds without unnecessarily adding to it. This new bird is a QUAIL. It is nothing else.

unnecessarily adding to it. This new bird is a QUAIL. It is nothing else.

Sportsinen of the Northern States may call our native Virginia partridge, or colin (Orthwwirptiamus, a "quail" if it pleases them better than a more appropriate name, but do not apply a misnomer when there is no occasion whatever for it.

Messina is the city from whence these quail were shipped, and the term is no more appropriate than would be New York, or Portland, as applied to quail. Do not use it, If the simple term "quail" is to short, call the bird a "migratory quail." Such a term is descriptive and appropos. apropos.

apropos.

In conclusion, I would say that my predictions, so confidently made, have thus far been verified. The qualicommenced breeding where liberated, immediately after their release, and have brought forth their young. Birds killed accidentally were found to be fat, therefore they have found sufficient food. I await with equal confidence to hear of their migration South in the autumn, and return next year. Beyond that my expectations give precedence to hope.

Col. Wm. Rhodes, of Quebec, who is much interested in the success of the importation, has enlisted the aid of the local papers in securing for the birds immunity among the farmers. He writes the following to the Que bec Morning Chronicle, under date of Aug. 1st:-

nec Morning Unronicle, under date of Aug. 1st:—
The news I get of the migratory quail from the different parts of the country are very satisfactory; the birds are doing well, laying eggs, and in some cases the eggs have been hatched; the birds do not appear to wander, and they keep well out of sight, but their presence is easily detected from "dustings," "droppings" and "digs" into ants' nests, also from "calls" or "pipings" which occur in the evenings.

The inhabitants in the country take quite an interest n the farmer's quail. One respectable lady told me they isang more beautifully than the "rossignol," and when I questioned her as to their plumage, she said they were "blue," so I concluded she was, politically speaking, in

isang more beautifully than the "rossignol," and when I questioned her as to their plumage, she said they were "blue," so I concluded she was, politically speaking, in a state of error. Our legislature, through the assistance of the Hon. Mr. Ross. M.P.P. for the County of Quebec, who got Mr. Watts, M.P.P., to draft the following anendment to the game laws, and which has now become law, has given this quaid question important assistance, and for which they deserve our thanks: "Any person who shoots or kills any migratory quail in this Province before the 31st day of December, 1882, shall be liable to a fine of not more than five dollars, or an imprisonment of not more than fitteen days."

It is not, however, by legislation the migratory quail can be protected. Land owners have to understand these birds belong to the farm, like the robins belong to the garden and the swallows to the house; that they are a delicious bird to eat, and worth 50 cents a brace in the market, besides being an object of sport for the young men, and above all, that the quail will return to their native farm, and when once there will live a quiet and retired life. The birds I have turned out on my land have not gone four acres from the spot they were let loose. The dry season is very much in favor of the young birds getting strong and growing rapidly. So far, the experiment is quite a success. The Quebec game law has been amended to provide a

close for the migratory quail to Dec. 31st, 1882

MIGRATORY QUAIL.—The Rutland, Vt., Herald and Globe says that Judge Everts is in "receipt of unmistakable proof that the migratory quail have returned to Rutland. They have been heard in the surrounding woods for several days, and their peculiar note cannot be mistaken. The judge was the pioneer in the movement for the introduction of migratory quail into this country, and has reason to feel gratified at the success of his pet project. The return of the birds in numbers to the spot where they first got this freedom in this country, is not and has reason to feel gratified at the success on the project. The return of the birds in numbers to the spot where they first got their freedom in this country is proof enough of the practical success of Judge Everts' theory. The judge is an enthusiast on the subject of game, and says that he would rather know of the success of his quail project than to leave a fortune at his death. He predicts that the migratory quail will eventually become the most numerous of all the game birds of America."

It is also reported that "several nests containing young Messina quail have been discovered in the Lewiston and Auburn (Maine) subtryls. The largest number of birds found in one nest thus far is fifteen and the smallest number five. It was feared that many nests would be destroyed by the teeth of the mowing machines during

number five. It was feared that many nests would be destroyed by the teeth of the mowing machines during the haying season, but the hay-makers gladly responded to the request to look out for the nests in mowing, and not a single case of loss from this cause has been reported in this county. One gentheman found that his cat had discovered a nest in his field and had killed two of the young birds just hatched. He protected the other little birds by putting a box with a small opening over the nest. The indications are promising for a large family of Messina quail in Maine next year,"

of Messina quail in Maine next year."

Toronto Game and Fish Protection.—The Toronto Globe has this resumé of the game prospect in the vicinity of that city: "The patiently-awaired for time of the sportsman has arrived, and the woolcock are now at his mercy. The fact of game being so scarce that hunters of the day are forced to penetrate the wools lumidreds of miles in quest thereof, will attest to the fact that the game laws cannot be too rigidly enforced. Had the generation past observed the economy in that direction which we are forced to observe, our sportsmen could enjoy their boutings in the vicinity of their homes, returning always with abundantly filled bags. The wholesale destruction of our birds of passage has tended more to their extermination than the denualing of the forest. This destruction applies to fish also. Who does not remember when the supply in Lake Ontario was adequate to the denand of all the residents upon its banks? That day is past owing to the destructive means used in catching them. Fishermen must now secure a license for their net privileges, while setting for fish in the spawning time in streamlest is strictly prohibited. Nor do the laws remain a dead letter on the statute book. Scarcely three months ago no less a personage than the President of the Long Point Game Association was fined heavily in Welland for an infraction of the game laws by the County Inspector. If he shot four quail as alleged, each bird must have cost him \$11.50—\$46 being the amount of fine and costs. Inspector Kerr, too, has frequently given signal proofs of his vigilation, and prosess of the stream of the game approach of his vigilation, or the same property given signal proofs of of his vigilation, and proofs of his vigilation, or the sorrow of many refracmust have cost him \$11.50—\$46 being the amount of fine and costs. Inspector Kerr, too, has frequently given signal proofs of his vigilance, to the sorrow of many refractory fishermen. In the Twelve, the Fifteen, the Sixteen, and Twenty Mile Creeks, County of Lincoln, he made a raid on more than one occasion to advantage, securing in the shape of trophies the tackleshidden in the water for trapping the unfortunate finny tribe. The Provincial Legislature is to be commended for extending protection to game and fish. The result will be satisfactory to the sportsman, though, like all enactments at their origin, the laws have yet to receive some alterations before they attain perfection."

MR. SQUIRES ON DITTMAR POWDER.—New York, Aug. 5th.—Editor Forest and Stream:—Allow me through your columns to thank the Dittmar Powder Manufacturing Company for the insertion, in their advertisement, of the fact that I am not an agent for the sale of their powder. The Dittmar Powder Company, which built the works at Binghanton, and put in, I believe, all the testing apparatus which is now in operation, became afraid longer to continue the manufacture of this powder, and, about August, 1879, sold out the whole concern to what was called the Dittmar Powder Manufacturing Company, which company is now running the works. At the tima of this sale, all my connection with the company ceased, as is very generally known to my customers. Allow me further to say, that the manufacture of the powder now, as then, is entirely under the direction of Mr. Carl Dittmar, and I believe no powder of this kind has ever been made in this country by any other man, and so the warnings against what is called old powder is a confession that Mr. Dittmar is atraid of his own compound, which he urged the people to buy last year. The changing of a name, and the putting a seal

over the top of a can, does not change the character of the compound, and, I believe, no one has asserted that the ingredients used, or the process of manufacture, are any different now than one year ago. When it is explained why it is that, from the same can which shows by pressure gauge below the strength which is safe with black powder for all ordinary guns, one cartridge will explode with a force so terrific as to tear to pieces the very best gun, and the next cartridge, and perhaps all the others, loaded from that can, give satisfactory results; and not until this is explained, will those who regard life and limb worth anything, experiment with this compound. After much consideration and some experiment, I have arrived at my theory as to the cause of such results; and I believe no pressure gauge, or strip of paper pasted on the top of the can, will prove effective against results in the future similar to those so often recorded in the columns of your paper in the past.

HENRY C. SQUIRES,

Cobe's Island Prices.—Poughkeepsie, N. Y., Aug. 7th.—Editor Forest and Stream:—In your last issue, a correspondent who signs himself "Chasseur," writes in glowing terms of the sphendid shooting to be had at Cobb's Island, Va., both now and during the late full and winter months. He refers, also, to the kind-hearded Cobb's and Spades, as being thoroughly bonest, and who will never seek to everyone the new them. Spades, as being thoroughly honest, and who will never seek to overcharge their patrons to the amount of a single cent. Will "Mr. Chasseur" please inform your readers how long it is since the kind-hearted Cobbs and Spades ceased to charge during the ducking and goose shooting season, the modest little sum of \$5 per day each for their services, and \$5 per day for very ordinary board, besides half the geese and duck you may kill.

The writer has done considerable shooting on the coast, from New England to Currituck, and of all the expensive places for accommodation offered, Cobb's Island, with the kind-hearted Cobbs and Spades as guides, take the front.

ONE WHO HAS BEEN THERE.

If this is the true state of affairs at Cobb's killend there.

If this is the true state of affairs at Cobb's Island, there is reason to believe that the birds will fly in peace there. We hope "Chasseur" will inform us on this point, for the Forest and Stream does not wish to act as a wreck-

ers' luring light.

Iowa Game Prospects.—Dubuque, .uuq. 4th.—Contrary to all expectation, our woodcock shooting has been very poor. It looked very favorable this spring and the birds got through resting safely, but the extreme high water (the highest ever known) came along just at the time when they go on the islands and into the bottoms, and, of course, drove then out of their usual haunts, besides destroying all vegetation; they scattered around the woods and on the steep sidehills, and it is impossible to make a good bag. One of our market hunters was out for three days and got forty-eight birds, but most of the boys come back empty handed. We will have more quail this year than for many seasons, as the netters and pot hunters have not been able to get them, still they are far from plenty, and a dozen is a big bag now where fifty would be a common occurrence six years ago. We have very few pinnated grouse, but the ruifed are quite plenty in localities. We look for good duck shooting this fall on the river and woodduck are very plenty now, and although the young ones are hardly able to fly, the pothunters are after them, heedless of the fact that the law protects them until Aug. 15th.

Julie.

Conserticut Woodcock,—Windsor Locks. Hartford Conaly, Conn.—There has been a great deal said through sporting journals about the shooting of game unlawfully in this section. We have been to considerable pains to learn the exact truth of the several reports, and find that not a great deal is carried on. The towns of Windsor Locks. Windsor. East Windsor, Suffield, Enfield, Granby, East Granby, Simsburry and South Windsor represent a large number of genuine sportsmen, whose aim it is to protect the game until it can be kilfed lawfully. All agree in saying that the last open winter has saved a larger number of birds than has been seen here in a number of years. Your correspondent was out a few days recently (without a gun), and in passing through five swamps roused thirty-three woodcock. We also came across over twenty-five gray squirrels, but did not see one partridge, Quail are plentiful, and rather tame. We cannot account for the absence of partridge, except that we did not go to the proper grounds for them. The towns named aforesaid comprise nearly the whole of the northern portion of Hartford County.

TENNESSEE DOUR SUGOTING.—Neshville. Aug 8th.—Our

northern portion of Hartford County. G. P. Co.

TENNESSEE DOVE SHOOTING—Nashville, Ang, 6th.—Our
sportsmen are now enjoying the "dove season." With
the ripening of the millet and corn these birds come by
the thousand, and as there is no prejudice in this country against shooting them, large bags are daily made. H. C.
Pritchett, one of our crack shots, bagged twenty-three one
afternoon, and Messrs. Burghloz, Mitchell and two others
brought home as their reward 125. The young doves,
when, as now, in good condition, make a most delicate morsel, preferred by many even to the quail. A
few days ago I was in the country, and noticed with
pleasure the fine prospects for fall shooting. Quail are
exceedingly abundant, while squirrels and rabbits were
never more nunerous.

J. D. H.

SNIPE SILIOTING AT GOOD GROUND.—Good Ground, Shinnecock Bay, L. I., Aug. 2d.—Snipe shooting is improving as the season advances, and the young birds begin to fly. We have been getting good bags right along for the past week, and the birds have commenced in earmest. Now, yesterday, Aug. 2d, we had a very good flight. Mr. A. Hass, New York City, killed 107 large snipe, and, while I write, I hear guns continually. I anticipate a big bag again to-day. The young birds are coming on now, and I look for a good season during August and September. William N. Lane.

Iowa Chicken Shooting—Creston, Iowa, July 30th.—There are more young prairie chickens this season than usual. Come out and help me hunt them. There will be fine shooting here in August—plenty of open prairie and room for all; no "beware of the dogs" and no "trespass on these premises" staring one in the face—all is open and free. Come and enjoy the great blessings of nature as spread out by the hand of God. N. D. M.

MASSACHUSESTS—Springfield, Aug. 5th.—Quail seem to be very plenty this season, and we hope to have some good shooting this fall.

BALSAM.

MINNESOTA.—Mr. Charles Hallock writes from Hallock, Kittson County, Minn., that the prospects for grouse and mallard shooting there are very good.

The Canton Rod and Gun Club, Collinsville, Ct., have enlisted the aid of their local paper, the Farmington Valley Sentinel, to make public the game law, and to urge true sportsmanship.

#### SHOOTING MATCHES.

SHOOTING MATCHES.

CAPITAL CITY GUN CLUB.—Washington, D. C., Aug. 3d.—The regular Saturday match of this club was deferred until yesterday Monday) afternoon, when the members met at Eagle Park at the terminus of the Columbia Tramway, where the matches will be shot in future. The grounds are perfectly suitable for shooting, and the chile concratulates itself on the change. After the match was completed Mr Mills shot twenty extra balls, breaking them all, making his score forty, straight, without a miss. Mr. McLeod also shot twenty balls for practice, breaking them all, but as he had shot the infinium number in the matches and was leading, he declined to shoot for record until his lead is overcome. The series for the two gold medals is nearly closed, with three members, Messrs, McLeod, Woodbury and Mills, so close that either may win, all the other members being out of the race. Mr. McLeod's average before yesterday's shoot was .942 per cent, with the other two within one-half of one per cent, of him. He has shot at 250 balls, breaking .945, Mr. Mills, 350, breaking 345, We consider that good shooting for amateurs. Mr. Mills's sho oting yesterlay will place him one-tent of one per cent, in the lead, yesterlay will place him one-tent of one per cent, in the lead, so the state of the state of the perfect of t we consider that good shooting to a mineurs. At a bits a so thing yestershy will place him one-tenth of one per cent, in the lead, which Mr. McLeod and Mr. Woodbury will no doubt try to overcome. The shooting yesterday resulted as follows—Card rotary trap, screened; smake target balls; handican rise:—

E.	L.	Mills			25	. 1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	Ţ	1	1	1::0

Torul 481 Total FOUNTAIN GUN CLUB .- The regular monthly shoot of the Foun FOUN-AIN GUN CLUB.—The regular monthly shoot of the Fountain Gun Glub, Aug, 4th, 7 birds each, 5 ground traps, handicapped rise, 50 yards boundary, use of both barrels, resulted in the following score: G. Joppert, 23 yards, killed H. straight; R. Van Staten, 22, 13 straight; Dr. D. Talbot, 39, 6; L. H. Smith, 30, 6; W. Martin, 25, 6; J. Fisher, 21, 6; W. R. Hunter, 23, 5; J. White, 25, 5; H. Hass, 26, 5; J. Kennedy, 21, 5; W. Cherry, 25, 4; E. Benson, 24, 4; C. Lemken, 22, 4; Captain Whitman, 21, 4; E. H. Madison, 30, 3; B. Cross, 21, 3.
HARRISBURG, 7a., Aug, 4th.—A well organized and genteelly conducted gun club is a good institution, even in this age. The busy cares of a business life must, now and then, be laid aside for awhile for the indulgence of those pleasures which make our lives hanny.

for awhile for the indulgence of those pleasures which make our lives happy. To manipulate a gun or rille skillfully and accurately -to be "a good shot," as the phrase is—is indeed an accomplishment, and I know of no means so well adapted to elevate the standard of accuracy in shooting as the friendly rivalry that obtains in a gun club where all the members want to become good shots. We have such an institution in Harrisburg, which is yet in its intancy, but which, judging from the keen interest its members accessed to the in the future, promises to be a success.

intancy, but which, judging from the keen interest its members appear to feel in its future, promises to be a success. Its membership numbers about thirty now, and out of these thirty a very clever shooting team can readily be selected.

A real live pigeon shooting match, where all is good feeling and carnestness is, of all held sports, the most exciting and pleasant. It is a real champagney. A challenge came from the West Fairview team and was accepted, and the match was shot at the Harrisburg Driving Park, last Saturday, the Blst ult., witnessed by, probably, 256 spectators. Shoot at 15 birds spiece from a ground trap, 21 yards rise, 80 yards boundary:

+ Challenged for shot mark and ruled out.
While it is manifest that the score is not first rate, about 40 per cent, of our birds having gone away or fell at the hands of scouters, it must be born in mind that it is our first match and our teams on both sides are comparatively inexperienced. Yet the missing of birds on both sides was unaccountably frequeut, for it was done by good marksmen.

Anon.

#### OF ENGLISH DOGGES\*

The first Section of this difcourfe.

The Preamble or entraunce, into this treatise.

Wrote unto you (well belowed friend Gesner) not many yeares past, a manyfolde historie, contayning the di-fers formes and figures of Beastes. Byrdes, and Fyshes, e sundry shapes of plantes, and the fashions of

uers formes and figures of Beastes. Byrdes, and Fyshes, the sundry shapes of plantes, and the fashions of Hearbes, &c.

I wrote moreouer, vnto you seuerally, a certaine abridgement of Dogges, which in your discourse youn the fourness of Beastes in the seconde order of mylde and tameable Beastes, where you make mencion of Scottishe Dogges, and in the wynding yo of your Letter written and directed to Doctour Turur, comprehending a Catalogue or rehersall of your bookes not yet extant, you promised to set forth in print, and openly to publishe in the face of the worlde among such your workes as are not yet come abroade to lyght and sight. But, because certaine circumstaunces were wanting in my brenary of Englishe Dogges (as seemed vnto mee, 1 stayed the publication of the same, making promise to send another abroade, which myght be commytted to the handes, the eyes the eares, the mindes, and the indgements of the Readers. Wherefore that I myght performe that precisely which I promised solempnly, accomplishe my determination, and satisfy your expectacion: which art a man desirous and capeable of all kinde of knowledge, and very earnest to be acquainted with all experimentes: I wyll expresse and declare in due order, the grand and generall kinde of English Dogges A gentle kind, apt for sundependent of the same, making a tripartite diuision in this sort and maner.

A gentle kind, apt for sunder processes and declare in due order, the grand and general kinde of English Dogges and the diuerse natures of the same, making a tripartite diuision in this sort and maner.

A gentle kind, apt for sunder processes and declare in due order, the grand and general kinde of English Dogges and the diuerse natures of the same, making a tripartite diuision in this sort and maner.

All English Dogges A bomely kind, apt for sun-be eyther of, dry necessary vses. A currishe kinde, meete for

Of these three sortes or kindes so meane I to entreate, that the first in the first place, the last in the last roome, and the myddle sort in the middle seate be handled, I cal the vinuersally all by the name of Englishe dogges, as well because England only, as it hath in it English dogs, so it is not without Scottishe, as also for that wee are more inclined and delighted with the noble game of hunting, for we Englishmen are adicted and giner to that exercise, and painefull pastime of pleasure, as well for the plenty of fleshe which our Parkes and Forests doloster, as also for the opertunitie and comenient leisure which wee obtaine, both which, the Scottes want. Wherefore seeing that the whole estate of kindly hunting consisteth principally.

ing consisteth principally.

In these two i in chasing the beast i that i bunting i pointes. In taking the byrde i is in (owleing i it is necessary and requisite to vnderstand, that there are two sortes of Dogges by whose meanes, the feates within specifyed are wrought, and these practivese or factinetic cunningly and curriously compassed.

One which rouseth the beast and continued to the chase, of Dogges in the chase, of Dogges Another which syrungeth the byrde and bewrayth flight by pursuite.

Both which kyndes are tearned of the Latines by one common name that is, Canex Vendrici, hunting dogges. But because we Englishe men make a difference between hunting and fowleing, for that they are called by these seural wordes, Venatio & Aucupium, so they tearme the Dogges whom they vae in these sundry games by divers names, as those which serue for the beast, are called Venatici, the other which are vsed for the fowle are called Aucupatorij. called Aucupatorij

. The first in perfect smelling The second in quicke spying
The thirde in swiftnesse and quicknesse The first kind called Venatici I divide into flue sorts. and quicknesse | Exect. |
The fourth in smelling & nymbleth. |
blenesse | The fifte in subtilitie and deceitfulnesse, | Players | Play

Of the Dogge called a Harrier, in Latin Lenerarius,

Latin Lenerarius.

That kinde of dogge whom nature hath indued with the vertue of smelling, whose property it is to vee a lustines, a readines, and a courageousnes in hunting, and draweth into his nostrells the ayre or sent of the beast pursued and followed, we call by this word Sagaar, the Greeiaus by, thy s word ichneutin of tracing or chasing by y foote, or simulatin of the nostrells, which be the instruments of smelling. Wee may knowe these kinde of Dogges by their long, large, and bagging lippes, by their hanging cares, reachyng downe both sydes of their chappes, and by the indifferent and raesurable proportion of their making. This sort of Dogges we call Leurarios Hariers, that I may comprise the whole nuber of them in certaine specialties, and apply to then their proper and peculier names, for so much as they cannot all be reduced and brought vader one sorte, considering both the sundrye uses of them, and the difference of their seruice whereto they be appointed.

The Hare

The Hare The Foxe The Harte The Bucke Some for one thing and some for another. Some for The Badger The Otter The Polcat The Weasell The Conny, &c.

As for the Conny, whom we have lastly set downe, wee use not to hunt, but rather to take it, somtime with the n ette sometime with the ferret, and thus every severall

sort is notable and excellent in his naturall qualitie and sort is notable and excellent in his naturall qualitic and appointed practice. Among these sundry sortes, there he some which are apt to hunt two divers beastes, as the Foxe otherwides, and other whiles the Hare, but they hunt not with such towardness and good lucke after them, as they doe that whereunto nature hath formed and framed them, not orely in externall composition & making, but also inward faculties and conditions, for they sward sometimes, and doe otherwise than they should.

Of the Dogge called Terrar, in Latine Terrarius.

Latine Terrarius.

A Nother sorte there is which hunteft the Foxe and the Badger or Greve onely, whom we call Terrats, because they (after the manner and custome of ferrets in searching for Connyes) creepe in the grounde, and by that meanes make atrayde, hyppe, and byte the Foxe and the Badger in such sort, that cyther they tears them in pieces with theyr teeth beyng in the bosome of the earth, or else hayle and pull them perforce out of their lurking angles, darke dongeons, and close causes, or at the least through cocened fears, drine them out of their hollow barbonners, in so much that they are compelled to prepare speedy llight, and being desirous of the next (abeit not the safest) refuge, are otherwise taken and intrapped with snares and nettes layde our holes to the same purpose. But these be the least in that kynde called Sagne.

Of the Dogge called a Bloudhounde in

The greater sort which serue to hunt, hauing lippes of a large syze & eares of no small lenght, doo, not onely chase the beast whiles it lineth as the other doo of whom mentoin about is madely but beying deal also by any maner of easanttie, make reconse to the per of the librate of the librate of the librate of the per of the per of the per of the per of the librate of the librate being the per of the per of the blond suggest that there you the ground. For whether the said beast beying shape is consuped clenly out of the parcke (so that there be some signification of blond shed) these Dogges with no lesses facilitie and easinesse, then auditie and greedinesse, can disclose and between the same by smelling, applying to their pursuit, agilitie and nimblenesse, without tediousnesse, for which consideration, of a singuler specialite, they descrued to bee called Singuitarij bloudhounds. And alheit peraduenture it may channe, (As whether it channed health one or sometime I am ignorant) that a perce of fleshe be subtily stohe and conningly contayed way with such prouisos and precaueats as thereby all apparature of these kinds of dogges by a certained, or consensus the deede doors, without wandring awry out of the limites of the land surface, pursue the deede doors, without wandring awry out of the limites of the land where the surface pursue the deede doors, without wandring awry out of the limites of the land where the surface and proposes and precede pursue the deede doors, or the contained of the land of the land of the limites of the land where the land was a surface and provided reaches, and werry and the surface of the land of the land

ing to the hunting kinde of Dogges, by the tearme aboue mencioned. To bee short it is proper to the nature of houndes, some to keepe silence in hunting untill such tyme as there is game offered. Other some so soone as they smell out the place where the beast lurcketh, to bewray it immediately by their importunate barcking, notwithstanding it be farre of many furlengs cowchyng close in his cabbyn. And these Dogges the younger they be, the more wantonly barcke they, and the more liberally, yet oftimes without necessitie, so that in them, by reason of they younge veres and want of practice, small ally, yet oftimes without necessitie, so that in them, by reason of theyr young yeares and want of practise, small certaintie is to be reposed. For continuance of tyme, and experience in game, ministreth to these houndes not onely cunning in running, but also (as in the rest) an assured foresight what is to bee done, principally, being acquainted with their masters watchwordes, eyther in reuoking or imboldening them to serue the game.

Of the Dogge called the Gasehounde, in Latine Agaseus

His kinde of Dogge which pursueth by the eye, preuayleth little, or neuer a whit, by any benefitte of
the nose that is by smelling, but excelleth in perspicuitie
and sharpenesse of sight altogether, by the vertue
whereof, being singuler and notable, it hunded the Foxe
and the Have. Tays Dozew will choose and succerate any the nose that is by smelling, but excelleth in perspicuitie and sharpenesse of sight altogether, by the vertue whereof, being singuler and notable, it hunted the Foxe and the Hare. Tays Dozge will choose and seperate any beast from among a great flocke or hearde, and such a one will it take by election as is not lancke, leane and hollow, but well spyed, smoothe, full, fatte, and round, it followes by the direction of the eyesight, which in deed is cleere constant, and not uncertaine, if a beast be wounded and gone astray this Dogge seeketh after it by the steadfastnes of the eye, if it channes peraduenture to returne and be mingled with the residue of the flocke, this Dogge spyeth it out by the vertue of his eye, leading the rest of the reated vintouched, and after he hath set ure sight upo it, he seperated it from among the company and haning so done neuer ceaseth until he have wearyed the Beast to death. Our countrey men call this dogge Agesseum. A gasehounde because the beames of his sight are so stedfastly settled and vinnouchly fastened. These Dogges are much and visually occupyed in the Northern parts and in feeldy landes rather then in bushy and wooldy places, horsemen vse them more then footenment of hintent that they might prooke their horses to a swift galloppe (wherewith they are more delighted then with the pray itselfe), and that they might accustome they horse to leape ouer hedges and ditches, without stoppe or stumble, without harme or lassard, without doubt or daunger, and so escape with safegard of 15te. And to the ende that the ryders themselues when necessitie so constrained, and the feare of further mischiefe inforced, myght saue themselues vindamilityed, and preuent each period to the ende that the ryders themselues when necessitie so constrained, and the feare of further mischiefe inforced, myght saue themselues vindamilityed, and preuent each periods tempest by preparing speedy flight, or else by swift pursute made typen they enimyes, myght both onertake them, encounter with them, and mak

Of the Dogge called the Grehounde, in Latine Leporarius,

Of the Dogge called the Grehounde, in Latine Leporarius.

There is another kinde of Dogge which for his incredible swiftnesse is called Leporarius a Grehounde because the principall service of them dependeth and consistent in starting and bunting the hare, which Dogges likewyse are indued with no lesse strength then lightness in maintenance of the game, in serving the chase, in taking the Backe, the Harte, the Lowe, the Foxe, and other beat-sets of semblade kinde ordained for the game of hunting. But more or lesse, each one according to the measure and proportion of theyr desire, and as might and habilitie of theyr bodyes will permit and suffer. For it is a spare and bare kinde of Dogge of fleshes but not of bone) some are of a greater sorte, and some of a lesser, some are smooth skynned and some are curled, the bigger therefore are appoynted to hunt the bigger beasts, and the smaller serie to hunt the smaller accordingly. The nature of these dogges I find to be wonderful by y'testimonial of histories. For, as John Froisart the Historicapher in his 4 lib. reported. A Grebound of King Richard, the second y' wore the Crowne and bare the Scepter of the Realme of England, neuer knowing any man, beside the Kings person, who Henry Doke of Luncaster came to the eastle of Flinte to take King Richarde. The Dogge forsaking his former Lord & master came to Duke Henry, fawned upon him with such resemblaunces of goodwyll and conceaued affection, as he fauoured King Richarde before: he followed the Duke, and viterly left the King. So that by these manifest circumstances a man myght indge this Dogge to haue ben lightened wyth the lampe of foreknowledge & understading, touchyng his olde master miseryes to come, and vnhappinesse nye and myght in dege this deede of his Dogge a Prophecy of his ouerthrowe.

Of the Dogge called the Leuiner, or Lyemmer in Latine Lovarius.

Of the Dogge called the Leuiner, or Lyenmer in Latine Lorarius.

Nother sort of dogges be there, in smelling singuler, A Nother sort of dogges be there, in smelling singuler, and in swiftenesse incomparable. This is (as it were) a myddle kinde betwixt the Harier and the Grehounde, as well for his kinde, as for the frame of his body. And it is called in latine Leatunrius, a Leutate, of lyghtnesse, and therefore may well be called a lyght hounde, it is also called by this worde Lorarius, a Loro wherewith it is led. This Dogge for the excellency of his conditions, namely smelling and swift running, doth follows the game with more eagernes, and taketh the pray with a solly onjetnes. nolly quicknes.

Of the Dogge called a Tumbler, in Latine Vertayus.

Latine Verlagus.

Ilis sorte of Dogges, which compassethall by craftes, fraudes, subtelties, and deceiptes, we Englishe men winding their bodyes about in circle wise, and then fearcely and violently venturing upo the beast, doth soddenly gripe it, at the very entrance and month of their receptacies, or closets before they can recover meanes, to sate and succour themselves. This dogge vest another craft and subteltie, namely, when he runneth into a war-

ren, or setteth a course about a connyburrough, he huntes not after them, he frayes them not by baroking, he makes no countenance or shadow of hatred against them, but dissembling friendship, and pretending fautour, passeth by with silence and quietnesse, marking and noting their holes diligently, wherin (I warrant you) he will not be ouerston for deceated. When he comment to the place where Connyes be, of a certaintie, he cowcheth down colose with his belly to the groud. Provided alwayes by his skill and polisie, that y' the winde bee neuer with him but against him in such an enterprise. And that the Connyes spie him not where he lurcketh. By which meanes he obtained the sent and sauour of the Connyes, carryed towardes him with the wind & the ayre, either going to their holes, or coming out, eyther passing this way, or running that way, and so prouideth by his circumspection, that the selly simple Conny is debarred quite from his hole (which is the hauen of their hope and the harbour of their health) and fraudulently circum-nented and taken, before they can get the aduantage of their hole. Thus hauing caught his pray he carryeth it speedily to his Master, wayting his Dogges returne in some connenient lurcking corner. These Dogges are somewhat piece than the houndes, and they be lancker and leaner, beside that they be somewhat prick eared. A man that shall mareke the forme and fashion of their hodyes, may well call them mungrell Grehoundes if they were somwhat bigger. But notwithstanding they counterualle not the Grehounde in greatnes, yet will be take in one dayes space as many Connyes as shall arise to as bigge a burthen, and as heavy a loade as a horse can carry. For deceipt and guile is the instrument wherby be maketh this spoyle, which permicious properties supply the places of more commendable qualities.

Of the Dogge called the themishe Dogge

#### Of the Dogge called the theeuishe Dogge in Latine Canis furus.

in Latine Canis furace.

The like to that whom we have rehearsed, is the theenishe Dogge, which at the mandate and bydding of his master steereth and leereth abroade in the night, hunting Connyes by the ayre, which is leuened with their sauer and conneyed to the sense of smelling by the meanes of the winde blowing towardes him. During all which space of his hunting he will not barcke, least he should bee preudiciall to his owne aduantage. And thus watcheth and snatcheth up in course as many Connyes as his Master will suffer him, and beareth them to his Masters standing. The farmers of the country and uplandishe dwellers, call this kinde of Dogge a pyght curre, because he functed in the darke, But let tims much seems sufficient for Dogges which serue the game, and disport of hunting. and disport of hunting

PRIDE OF THE BORDER .- It was with deep regret that we were obliged to notice, in a recent issue, the death of this most celebrated dog. Pride of the Border was bred in 1869 by Mr. E. Laverack, at Broughall Cottage, Whitchurch Shropshire, England. His dam was the pure Laverack Belle II, and his sire was his breeder's fa-mous old Blue Dash. This dog, Dash II, was probably the most useful and valuable sire of English setters known in modern times. His most famous son was Pride of the Border, from whose loins are descended the best known and most admired English setters of the day, both in England and America.

Mr. Laverack offered Pride of the Border for sale in 1874, and he was promptly secured against a strong and widely spread competition, along with the far famed Fairy (Dash II-Moll II), through the efficient offices of Capt. John W. Taylor, at that time kennel and field editor of the Forest and Stream, for the kennels of Mr. Charles H. Raymond at Fox Farm, Morris Plains, N. J. Pride was handled on American game by Col. E. M. Ouimby, of Morristown, N. J., and being a dog of remarkably high intelligence, soon developed into a very fine quail dog. He was up-headed, never seeking a ground scent, but always working for his birds on the wind, with a long, swinging, panther-like gallop, and a nose of such delicacy and keenness as to save his legs many and many a rod of ground in quartering.

In England, Pride left behind him to perpetuate his

line such splendid sons as Blue Prince, Bandit and others equally well known. Dying in America, his mantle-so to speak—in the stud falls upon sons also famed as sires. Thunder, St. Elmo, Roderick Dhu, Guy Mannering, Brough, Pontiae, Promise, Ray and others will long live in canine history as claiming Pride of the Border for their sire. The grand setter, Dash III, is a grandson of Pride through Blue Prince, and in many features strongly reminds one of his grandsire.

Worn out in service, feeble with age, completely blind and deaf, gallant old Pride of the Border tottered but recently to his honored grave at Fox Farm, leaving a rich legacy of pure setter blood and high intelligence to his posterity. It will be long before his vacant place

Toronto Doo Show.—Since the issue of the original prize list of this show, which we published in our issue of July 224, it has been decided by the management to still further enlarge it. We therefore take pleasure in giving a full copy of the classes and prizes, as amended:—Class 1—Setters (English), dogs—first, \$10; second, \$5. Class 3—Setters (English), bitches—first, \$10; second, \$5. Class 3—Setters (English), puppies—first, \$7; second, \$4. Class 4—Setters (Irish), bitches—first, \$10; second, \$5. Class 5—Setters (Irish), puppies—first, \$7; second, \$4. Class 5—Setters (Irish), bitches—first, \$10; second, \$5. Class 5—Setters (Irish), bitches—first, \$10; second, \$5. Class 8—Setters (Irish), puppies—first, \$10; second, \$5. Class 8—Setters (Irish), puppies—first, \$10; second, \$5. Class 8—Setters (Irish), puppies—first, \$10; second, \$5. Class 9—Setter (black and tan), bitches—first, \$10; second, \$5. Class 11—Pointers, bitches—first, \$10; second, \$5. Class 12—Spaniels (Class 10—Pointers, bitches—first, \$10; second, \$5. #### THE CANADIAN RIFLEMEN.

O'S sunday morning last, by the early morning train over the Eric Road, the team of Canadian rillemen from the Victoria Rifle Club, Hamilton, Ontario, strived at Jersey City. They were met at the Jersey City Ferry by R. H. Keene, the President of the Amateur Rifle Club, and Capt. L. C. Bruce, who secorted them to the Union Square Hotted and thence to Creedmoor, where they will remain until the match is shot. The team comprises Col. Gilson, Maj. Frothergill, Dr. McLaughlin, James Adam, Joseph Mason, F. Schwarz, Albert Paine and William Mitchell. They are a remarkably fine body of men, Col. Gibson and Dr. McLaughlin being members of the Provincial Parliament. Six of the riflemen are to shoot in the team, and the others are to act as a reserve. The selection was not to be made before Wednesday. Wednesday

The American team in Saturday's match will comprise L. Webher, J. I. Alien, L. L. Hepturn, H. S. Jewell, J. H. Waters and another, though the team will be chosen later in the week. The Canadians have all abandoned the old-fashioned muzzle-loading run, with which they shot the last match in this country, for

gun, with which they shot the last match in this country, for American breech-loaders. Mr. Adam, speaking of his chances, said that he did not think that his team stood much show of success satist the team that would be pitted against them. 'In 1875," said he, 'we came here to give the American riflemen a lesson, and now we have come over to receive one." Mr. Adam is the gordeman who won the dirst gold medal ever shot for at Cycedmoor at long distance ranges. The other members of the visiting team do not heristate to acknowledge the present superior shooting of the American marksmen. Messrs, John Harvey, Joseph Simpson, the son of Senator Hope, F. F. Dolly and Alderman John Crear have accompanied the Canadian team from Teronto. John Harvey will capitain the Canadian team, and Richard H. Keene the American team.

The visitors have come down to win, and will shoot each day:

team.
The visitors have come down to win, and will shoot each day: taking only Thursday for a run to Coney Island for a dinner given by the Amateur Club. The match is the third of a series between the two clubs. The Canadians were beaten at Creedmoor, Sept 25th, 1875. Then, after the Centennial match, in which Canada also appeared, the Amateurs visited Toroxto, and returned good for good by giving their hosts a good defeat after a hearty reception. The present match is the sequence of the others, and a close tussle is looked for.

On Monday, in accordance with previous arrangements, the Canadian ritle team went before the butts early for their first practice. They could not have desired more favorable weather for shooting. It was not intended that the several members of the team would shoof full scores at each of the ranges, but rather that the men should commence the week's practice, which is to culminate in Saturday's match, by getting the approximate elevations at the several distances and working themselves into form. The practice was, therefore, of a desultory nature, but it proved to be quite satisfactory. Lieut.-Col. J. W. Gibson, of the Thirteenth battallon, who is the leading shooter of the team, made 31 out of a possible 35 at 800 yards, and at 400 yards he made? Consecutive bullseyers—that is, 35 points out or 35. Mr., William Mitchell recorded 33 out of 35 at each of the 800 and 900 yard ranges. Mr. Albert Paino perioned the creditable feat of putting up 12 out of 75 points at 1,600 yards. At the same range Mr. Frederick Schwarz made 67 points, Liut. J. Acam 87 and Mr. Mitchell 66. Mr. Frederick S

THE HALFORD-HYDE MATCH ABROAD, -A very good notion of the current English opinion on the recent scrub match between English and American eights at Wimbledon, may be formed from the clippings from London journals given in our rifle columns. The timely action of the National Rifle Association on this side the water, and its consistent assertions that the American squad could not be recognized as a representative body. and had no authority to assume any such character had a good effect in inducing the British National Rifle Association to take a similar attitude toward it. We have failed to note that any special effort was made by the English papers to dwell on the merits of American rifles, and generally, in its only honest guise, as an advertising scheme, the match was a flat failure. no evil, it is said, entirely unmixed with good, and we will wait patiently for the kernel of consolation from the midst of this olla podrida of mismanagement. If it will only lead to the utter stamping out of that pest of rifle shooting, the professional-as illustrated in the person of the American team manager in the disgrace of July 24th the match would have been a grand and dazzling suc cess, and none will regret to see a hyde tanned in its own nickle

ENGLISH VIEWS OF THE HYDE-HALLORD MATCH. The Lor don exchanges of the 26th ult. bring the comments of the English press on the flasco of the 24th at Wimbledon, and it can hardly be said that Hyde's advertising intentions were very fully realized on that side the ocean any more than on this side.

Some of the papers comprehend the insignificant character of the match, while others persist in styling it an international affair. The Echo says: "On Saturday the great long-range match with any rifles between Sir H. Halford's British team and Mr. F. With any first severe set at the majority shifts team and set, r. Hyde's American team was contested. The contending teams were not recognized as national representative teams, but simply as the teams of individuals. The best men, however, that the countries could produce competed, armed with the most highly finished and accurate weapons."

The Pail Mail Gazette devotes two lines to a report of the match. rate Patt state cascate devotes two injector report of the maten, saying: "The international match between the British and American teams was shot earlier in the day, and was won by the British by 79 points."

The Times' report of the match says of it: "The great long The Times' report of the match says of it: "The great long-range match with any rifles between Sir, H. Halford's British team and Mr. P. Hyde's American team was shot on Saturday. It has been specially amounced that the contending teams are not recognized as national representative teams, but merely as teams of individuals. No such amouncement, however, could deprive the match of its interesting character, it being shot by the best men that the respective countries can produce, armed with the most highly faished and accurate weapons that are made."

From an extended report in the Dally Telegraph the following is taken: "The most interesting even on Saturday was that be-

From an extended report in the Daily Tilegraph, the following is taken: "The most interesting even too Saturday was that between the British and the American teams at long distances, though it was not officially recognized either here or across the Atlantic, the men shooting simply as individuals. During the meeting our American cousins had shown themselves such adopts with the small-bore rifle that had there been any formal betting with the small-bore rife that had there been any formal betting the odds would certainly have been in their favor, notwithstanding the edds would certainly have been in their favor, notwithstanding the edecition for private reasons of two of their best shots. There Hounslow form when practicing for this match, and when they beat the top score for the Eticho Shield, did much to create this strong feeling of confidence, but as the sequel proved, their supporters had reckoned without their host. The weather, but has to light and wind, was unreservedly in favor of good shooting, and the British team—which, by the way, did not include a Scotchman—took full advantage of it. At the termination of the match Sir H. Hatford, the capitain of the British team—to whose excellent judgment in the selection of his men the victory is due—called for three cheers for the Americans, who, he menioned, had never before been beaten. The demand was most heartily responded to; and Mr. Hyde, responding to the combliment, took credit for having taught the British how to beat the Americans, by inducing them to adopt the breech loader in Heu of the old muzzle-loader. He expressed his regret at the absence of Dr. Clark and Mr. Farrow, whose desertion had contributed to their defeat."

The Standard comprehends the situation very clearly when it says: "But for the first time in its history the closing day witnessed a great rifle match between teams of eight men respectively, representing Great Britain and America. Although it was originally amounced that this was to be considered as an international contest, the National Rifle Association of America declined to consider the gentlemen visiting England as a representative team, and it therefore simply resolved itself into a match between "Eights" of America and the United Kingdom, selected by their elected captains, Gen. Hawley (?) and Col. Sir Henry Halford. The conditions were the same as for the Eleho Challenge Shield, viz., 15 shots each at 800, 800 and 1,000 yards. Through some misunderstanding among the American rillemen Mr. Rockwell was substituted in the team for Mr. Farrow, and, owing to a breakdown with his ritle, which had to be changed at 900 yards, this gentleman made a very low score." The Standard comprehends the situation very clearly when it 900 yards, this gentleman made a very low score

owing to a breakdown with his rifle, which had to be changed at 900 yards, this gentleman madea very low score."

The News, speaking of the contest, says: "Of the two competitions to which all the shooting was on Saturday confined, chief interest naturally centered in the international match. There was much curiosity to see whether the Americans would be able to rival the wonderful score they had made at Houndslow on Thursday, and great anxiety to insure accuracy of marking. To this end the Council had consented, on the requisition of the British team, to allow the presence of two strangers in the butts, charged with the duty of watching and verifying every shot on behalf of the Americans, whose capital had, however, declared that he considered such a precaution quite unnecessary. They commenced the match at 80 yards about 1839, under perfectly favorable conditions of wind and light. At the very first round the British began to draw away, and were never afterwards caught, although the Americans struggled hard to reduce the lead. In justice to them it must be said that they were heavily handleapped by the defection of one of their team and the non-appearance of a famous marksman on whose presence they had relied. The reserves had to be called up, and though the non-spheatance of a manous marksman of winose presence they had relied. The reserves had to be called up, and though one of them shot very steadily, the other yielded to the strain of a position that might try the nerves of many a good man. The British, on the contrary, was probably the strongest teëm ever brought together in this country. Their shooting at the first range was simply superb. At the conclusion of the match Sir

Henry Halford asked his team to give three cheers for the Americans, over whom they had never expected to gain such a victory. In reply, Mr. Hyde, who acted as captain in Gen, Hawley's absence, said he claimed the victory for the Americans, inasmuch as they had taught Englishmen to diseard the muzzle-loader and take to the breech-loader, and also not to depend on individual merit, but to strive altogether with one object in view. After a cordial interchange of cheering the teams senarated

#### BUFFALO VS. HIGHLAND PARK.

HIGHLAND PARK, III. Jun 2d

During the recent grand annual meeting, at Buffalo, arrange ments were made by the Buffalo Toxophilites and the Highiand Park Archers to shoot a series of four matches, on the fol-lowing conditions, viz.: Each club to shoot a feam of six, on its own ground, 96 arrows at 60 yards, the scores to be reported by

Editor Espect and Strongs

On the day set for the first match, Highland Park succeeded in getting out only four of the team, and on the date appointed for the second, fluidalo was one man short. Though the shoots on the first two days cannot be called matches, we give the scores. It will be seen that the Highland Park Archers won on days

ach club presented its full team. First match, July 20th :-

ssened my 60 yards score July 30th,otherwise I hoped have scored my first 400 point York Round. July 29th, after

to have scored my first 400 point York Round. July 20th, after finishing my York Round, I continued at 00 yards and made 47 mishing my York Round, I continued at 00 yards and made 47 consecutive hits at that distance. Have only shot about a dozen American Roundsin ail, and pay very little attention to same. The Symat of Archeray,—Hackensack, N. J., July 30th,—I think Mr. Walworth hits the nail on the head in his article last week on "Innovations in Archery," and "Young-Man-Afraid," etc., is wrong in comparing wrohery with ritle shooting. Archery does not compete with rifle shooting in the way of accuracy, Archery is a splendid exercise, and in its present shape requires long and patient practice before any results are obtained in the way of scores. The fact that it is so difficult lends a certain charm way of scores. The fact that it is so difficult lends a certain charm way of scores. The fact that it is so difficult lends a certain charm to it. If all sorts of innovements are to be added to the long bow in the way of patent sights, triggers, arrow holders, etc. why no take up the cross bow or the rife at once? Even in rifle shooting there is a limit, and rests, bair triggers and telescope sights are prohibited. W. HOLBERTON.

THE BAY REGATTA AUG, 9TH.

WITH the usual southwest wind of this time a year comparatively little is to be said about the racing witnessed on Monday, Aug. 9th, as it was Indian file all around the course, though the Indians did hunt each other in a most unnistable inanner, he had been to be a said about the racing witnessed on Monday, Aug. 9th, as it was Indian file all around the course, though the Indians did hunt each other in a most unnistable inanner, part to be accounted for by the fact that the racers included the pick of their kind in every class, and it was more, a match between the skippers in charge, mingled with such luck as was to be obtained out of a wind which held pretty steady all aly. For the theorem is a state of the committee, whose names have already appeared in these columns. They had the disagreeable duty before them of collecting funds from all sources within a very short period of time, and thave fallen through. As it was, they found themselves heavily handicapped by the previous tailure of 15/8, when, after a day's hard work at tiller and sheet, it was discovered that there was no money forthcoming for the racers, and many learned this year's rangements were in different bands, and the fullest confidence was reposed in the managers as soon as this became thoroughly understood. Next year much less diheduly ought to be experted to the superior of the racers and the fullest confidence was reposed in the managers as soon as this became thoroughly understood. Next year much less diheduly ought to be experted to the superior of the prevention of the

to be handed to the New York Bay Union Regatta Committee. I shall be pleased to hand the same to them at their next meeting and have no doubt they will appreciate the favor. Yow York, Aug. 10th. Jun Frick, for the Committee.

#### BEVERLY YACHT CLUB.

#### FIFTY-SEVENTH REGATTA,

Editor Forest and Stream:

The second championship results of the club, for the season of Bed, was saided at Swampscott, July 31st; wind west, about a 6 knot breeze at start and finish, but lighter during the larger part of the race. Course for first class, from Judges' yacht of part of the race. Course for first class, from Judges' yacht a state-boat off the southwest part of the Fig. 1 mutted miles. Course for second and third classes, from Judges' yacht, leaving a stake-boat off the southwest yacht. It is nautical miles. Course for second and third classes, from Judges' yacht, leaving a stake-boat off the start of the start of the first class. A feffres, on board flagship Clochette.

The preparatory gun was fired promptly at 12 M, and that for the first class for minutes later. The yachts started well together, all having large topsaits; Nondard setting her balloon jit topsal while the others carried ordinary ones:

Name and Owner.	Water Line.	Start. H. M. S.

the smoke from campaign stained pipes curied aloft in ringle's At 10 A.M. it was decided to paddle off the general contest for the handsome cance presented by Mr. Rushron, of Canton, N. V. House and return. "Salow very leader to a mark off the lake flows and return. "Salow very leader to a mark off the lake flows and return. "Salow very leader to a mark off the lake flows and return. "Salow very leader to a mark of the lake flows and return. "Salow very leader to the line Messrs Swain, Greenough, Wallace, the Wallish Gardford, Stephens, Decker, Johnson, Cook, Prottingham, Hubbard, and the Rev. ontested. Wallace, the Van Hanger was exceiting and closedy contested. Wallace, the Van Hanger was present and fourth, The result called forth preat, cheering on some. In the attention the 5-mile "go as you please" under sail, was announced, but, for the receible of the present called forth preat, cheering on shore. In the attention the F-mile "go as you please" under sail, was announced, but, for the receible of the sail of the present called the sail of the called the control of the sail of the called t

sport, and that cities will be formed throughout the land wherever there is water enough to float a canne.

BUFFALO VACUE CLUB.—The second race of the the season was sailed July "5th upon the occasion of officially opening the new citie house on the stone breakwater. The yachts were all statted in one class to sail twice over a six mile triangular course. Entries, sloops, Arrow, 25.2ft., Messers, Bowen & Smyth; Curlew, 29t., Messers, Disworth and Parker; Turk, Thos. Frank, Sch omer, and Mills. The start was made at 245, Arrow going into the feed and Mills. The start was made at 245, Arrow going into the feed and once. The two schooners fouled before reaching the mark, but without damage, the Alarm going into second place after rounding the first totor. As the breeze piped up Arrow increased in panel the first totor, As the breeze piped up Arrow increased up and the second round was a procession in Indian file, Arrow winning in 2025 corrected time; Alarm in 27.5% Curlew 21.25, Turk 21.918. First and second prizes were handsome phores of yachts. Judges, Capt. Judn McKenna and Capt. Ben Hammond. The new on nice piles, \$ft. above water. A broad vernada uffords a factive of the course, and besides the roof has been surmounted by a tent enony?. A set of colors have been presented to the club by Mr. Mecool, Asst. Div. Sup. of the N. Y. C. R. R.

by Mr. McCool, Asst. Div. Sup. of the N. Y. C. M. R.

Haddenouth—This is the name given to the new sloop built
by Cuthbert, of Trenton, Ont., and just delivered to her owners,
Messrs. Robert Cummings and A. Paient, of Toronton. Her dimensions are, 571, 636. keel; c2ft, over all; 18ft. 10in. bram, and
draw 4ft. 6in. water aft. Mainmast, 5971; top-mast, 39ft; boycanvas under full-sail, 4,560ft. Her necommedutions are large and
elegant. The yacht is said to have cost \$3,000. A chicago gentieman is spoken of as a likely purchaser.

CRUSING ON THE LAKES.—One of the 'most hopeful signs of
yachting in the West is the amount of crusing done. All our
exchanges from the lake ports teem with amounements of
more than anything else.

ENGLISH RACKIN—This is the was they make the thing my

ESGLISH RACING.—This is the way they make the thing pay across the water. The Florinda, yawl, 135 tons, was launched un 1573, and has won \$25,000 in seven years' nacing, not including south as won eleven three and one second in fourteen paces sailed to date,

ears. What will make the hair grow? Ans. Rub the bare spots with sulphur of atment, and give two drachms of sulphate of magnesia every morning.

J. E. H., New York.—Putnam's Dan was by Palmer's Dash, out of Putnam's orange and white setter bitch Nell; Nell from imported stock on both sides. We cannot give you the correct pedigree of Nash's Fan, although we are well aware the Nash stock was hard to beat a few years ago. Perhaps some of our readers can furnish this information.

F. H., Boston, Mass .- There is not very good shooting F. H., 160800, Mass.—There is not vory good smoothing ordinarily at Point Judith, only a few yellow-legs and ving-necks about the pond. But about the last of August or lst of September, after a northeast storm, there is often grand shooting at golden plover, black-breast plover and fute, or Esquinaux curlew, in the lots back of the Point. You will have to drive from Wakefield, we presume.

W. H. S., Tampa, Fla.—The name of the seaweed which you send is Eucheuma isiforme. This and many other red algae should be floated on paper from sea water, as fresh water destroys the flue color. After floating it out on paper, cover with thin muslin and press gently between several thicknesses of blotting paper, changing the blotters often, till the sea-weeds are perfectly dry. We publish full directions for collecting sea-weeds elsewhere.

We publish full directions for collecting sea-weeds elsewhere.

A.P.J., New York. Can you give me any information in regard to trout-fishing in the Eagle and neighboring lakes and streams in the north of Maine, the facilities for reaching there, and whether guides can be had? Can they not be reached by going from Mooschead Lake in a canoe and with carries? Have you ever heard of anyone taking that trip? Ans. Trouting is good all through that country. The lakes you mention are difficult of access; many carries through swamp lands. A party of cult of access; many carries through swamp lands. three tried it last season, but abandoned it. You would have to take Moosehead guides.

B. R. Houston, Texas.-The nedigree of the only Rufus II we know of is as follows: By Rufus out of Friend. Rufus' for-mer owner wa Mr. Arnold Burges, Hillsdale, Mich., since owned by Mr. M. Von Culin, Delaware City, Del.; breeder, Capt. Thomas Trench, Ireland, whelped April, 1873, deep red, no white; by C. S. Trench's Shot out of Capt. Trench's Linda; Linda, by Hendrick's Fronton Smit out of Adair's Golla. Priend, owned by Mr. E. P. Stod-dard, Bayton, Oblo; breeder, Rev. J. C. Leigh, England; deep red, white on chest, loes and tip of stern; by Leigh's Flash, out of Kayananth's Stella; Flash by Pat, out of Major Martin's Flash; to Stella by Watson's Stello, out of Kayanangh's Ruby, Rufus II, was a winner at the centennial.

H.S. H., Bellefonte.—You have neglected to state the age of your setter dog. He is evidently out of condition, but if you will adopt the following treatment he will, no doubt, come around alt right within a short time. For a full grown dog give a teaspoonful of sulphur, followed in the morning my a dose of sulphate of mannesia; varying trom a dessert to a tablespoonful. Perhaps the best way to administer this mild cathartic is to dis-Perhaps the best way to administer this mid cathartic is to dis-solve it in water and pour it down the animal's throat, omitting all food until an bure or two later. Avoid giving meat for sev-eral weeks, and exercise freely every day. Continue the sul-plur and the sulphate of magnesia daily, regulating size of doses according to condition of dog. After a fair trial of a week or ten days administer two grains of quinine three times a day.

days administer two grains of quinine three times a day.

G. H. P., Boston, Mass.—Your description points to external canker. Give dog a purgative every day for a week; two drachms of Epsom saits will probably be all that is required. His diet must be light, and without meat, and consist partly of boiled green vegetables. Carefully wash both ears with lukewarm water, and in the case of ditr or hardened wax, syringe the eurs and pour in a tew drops of olive oil. As the day of the ear is probably thickneed and filled with luid between the cartilage and the gristle, cut them with a bancet and press out the bloody matter, and let them be touched with the following liniment: Take Goulard's extract of lead one ounce, glycerine and carbolic acid one quarter of an ounce, fines olive oil four and a balf ounces. Mix the two first named and add the oil gently, rubbing together in a mortar. The bottle must be well shaken before together in a mortar. The bottle the liniment is used. Write result. The bottle must be well shaken before

J. L., North Scituate.—I have a Newfoundland pup, seven months old, that has been sick since April. He began by throwing up his food. I gave him sulphur for two or three weeks and then quintine. He suddenly became worse, and began to swell, and as I thought showed signs of peritonitis. He was subsequently freated for worms, without passing any. Should a log be allowed to eat his food after he has finrown it up? What shall I do for him? Ans. The present symptoms point to gastriffs, although you may have been correct in your first diagnosis, that he was afflicted with peritonitis, which may have 'coexisted. So long as vomiting continues give no solid food. Meat broths, milk gruel, etc., being proper diet. At this singe medicine is not likely to be of much avail, but would advise the administration of the sub-carbonate of bismuth, fifteen to twenty grains, three times a carbonate of bismuth, fifteen to twenty grains, three times a . No dog should be allowed to eat the food h; has vomited.

### PUBLISHERS' DEPARTMENT.

THE SUMMER SOLSTICE -One great reason why bot weather THE SYMMER SOLSTICE—One great reason way not wearner isso debilitating lies in the fact that the body is exhausted by the labors of the year. Indeed, it is natural that this should be so. In order, therefore, to resist this tendency to exhaustion, it only becomes necessary to relaviscorate the body, which can readily be done by one or two bottles of Warnor's Safe Tonic. This dy is being extensively used by physicians for this purpose, and is for sale by druggists in all parts of the world.

All orders for my patent rough glass balls hereafter should be addressed to J. Palmer O'Neil & Co., Pittsburg, Pa. A. H. Bogardt s.

A. H. BOGARDUS.

BOGARDUS BALLS.—All orders received by us for the Bogardus patent rough ball will receive prompt attention. Hereafter these balls will be packed in barrels containing 250 balls, and will be packed as securely as possible to prevent breakage in transportation. The quality of the ball will be greatly improved. Send for prices and sample ball.

### J. Stevens & Co.'s Celebrated Arms.

EAST BLOOMFIELD, N.Y., March 14, 1878.

J. Sterens & Co. wish to say a word in regard to the gun I purchased of you some time ago. In the gun I purchased of you some time ago. In the gun I purchased of you some time ago. In the gun I purchased of you some time ago. In the gun I purchased of you some time ago. In the gun I purchased of your state of the gun I purchased to be the best shooting gun in this town. There are guns, both American and English, which cost from \$50 to \$125, but I can safely say that not one of them can equal mine shooting which a would be almost impossible to excel. In fact, I believe that Stevens' single-barrel shot-gun is the 'lightest, cheaped and both gun for all kinds of shooting in the world. Some ago. Most respectfully yours.

### FOREST & STREAM.

NEW YORK, THURSDAY, AUGUST 19, 1880.

#### THE TILESTON MEMORIAL FUND.

NEW YORK, Aug. 7th. Editor Forest and Stream:

I have to acknowledge the receipt to date of further subscriptions to the "Tileston Memorial Fund," as follows:— 

next regular meeting (in September) of the Eastern Field Trials Club.

FRED. N. HALL, Secretary.

We have received and transmitted to Mr. Hall \$5 for

the fund, from Mr. A. S. Smith, New York City.

Dr. Ruth.—Dr. Ruth, the California rifle expert. will give an exhibition at the Brooklyn Driving Park, Parkville, L. I., next Saturday afternoon at 3 o'clock. His wife will be present, and will exhibit her skill with rifle and pistol. The shooting will be at glass balls, and if Dr. Ruth performs the feat he has had the credit of accomplishing on the Pacific Coast, the entertainment next Saturday will be well worth witnessing.

-By a very curious coincidence we publish to-day "Bodines" note on the mother woodcock, which shams lameness, and another account of the same trick of the duck, the latter written three hundred years ago. The chapters of the book "Of English Dogges" to-day contain much that is novel; but much of these old descriptions would answer very well for the present if put into modern English.

#### THE NEW YORK FISH COMMISSION.

MEETING of the New York Commission was held in A MEETING of the New Lond the subject of the salt water fisheries came up for discussion. These have never received much attention, if any, from the Commission, although New York has in Long Island a fine stretch of coast, interspersed with magnificent bays, where not only are tons of fishes taken by professional fishermen to supply the great markets, but is a favorite resort for anglers, who take great quantities of bluefish, weakfish and others, which are partly consumed in the hotels, and the remainder find a market in New York, for the angler pays his boatman by the day, and usually gives him all the fish, and there are probably five hundred men in the towns about Great South Bay alone who live entirely during the summer season by taking parties of anglers out to fish, thus earning from four to five dollars per day, the usual price for a three to five ton cathoat and man, while the fish caught will bring about as much more in many cases. There is no fresh water angling within the waters of the State to compare to it, and it is a question if the commercial fisheries of Long Island do not equal in value those of the rest of the State. Of course no correct estimate of such value can be made until the returns from the experts of the United States Fish Commission, who are collecting statistics in connection with the census of 1880, are all in.

At this last meeting Messrs. Roosevelt and Blackford were appointed a committee to investigate this subject. and report at the next one the propriety of establishing a station for observation on the habits of valuable sea fishes, and perhaps propagate them. The time has come when this should be done. Fish culture has broadened its field, and no longer contines itself to the salmonidæ or to stocking inland lakes and ponds with bass and "bullheads." The sea is the great feeder of mankind, and the possibility of its being made to produce more of certain favorite kinds is now being rapidly demonstrated, and the New York Fish Commission is awake to the fact, but alas! just as they are about to move in this matter their appropriation is cut down and they are powerless.

If ever the State appropriated money for the future benefit of the people, it was in the small amount given for fish culture, whereby the people obtained cheap and wholesome food from sources which were otherwise unproductive, evidence of which can be obtained from many portions of the State.

The bluefish (Pomatomus saltatrix), seems to hold its own, but most of the other valuable food fishes have decreased in numbers within the past twenty years. Perhaps this is on account of increased fishing; if so, there has been also an increase of population demanding food, and the way to increase the fishes is not to stop or prevent fishing and wait, in old fogy fashion, for them to increase themselves, but to hatch them by the million or the hundred of millions, and destroy the sharks and other enemies. If our net fishermen could be induced to kill sharks, sculpins, toad fishes, etc., instead of lifting the net and getting rid of them in the easiest manner, one good point would be gained and the fishermen and fish commissioners would work in harmony as soon as the former learn that their interests are identical.

VALUED COADJUTOR .- It is satisfactory to notice that Land and Water very heartily supports the posi-tion taken by FOREST AND STREAM on the subject of summer woodcock shooting. The writer of the article alluded to, after quoting from our recent article on this topic, states that he has "seen young woodcock in more than one of the markets of the Eastern States in July not more than half fledged." The truth is, that the season for woodcock should not open much, if any, before Oct, 1st, and the sooner this fact is recognized by sportsmen of the better class, the sooner the reform which we all desire will come about.

-Mr. Jerome Marble starts from Worcester, Mass., Sept. 3d, in the sportsman's palace car, the City of Worcester, for a short trip in the Northwest.

#### IT IS THE CAT.

F EW people, we imagine, realize how full of vicissitudes and perils is the life of our upland game birds. Take, for example, one of those quail hatched not a hundred rods from your doorstep and reared on your own farm, whose parents you heard whistling on the fence, or the old rocky knoll, every day through the spring and summer-have you ever thought how many enemies that little thing had to contend with, and how small was the chance that it would ever attain its full size, and spring from before the dogs in November a full fledged bird? From the time that it struggles out of the shell till the hour when, struck by the leaden hail, it turns over to the shot and is pocketed by the satisfied shooter, its life has been one of constant watchfulness, one long series of efforts to escape from constantly impending perils.

The egg from which it is to emerge has been deposited. The parent birds have not been destroyed by the deep drifts of the previous winter, nor have they fallen a prey to the small boy and the pot hunter, who, when the weather is favorable for such nefarious practices. track the innocent birds over the light snows, and shoot them when huddled. The nest is prepared and the eggs are laid. Now, other dangers threaten. If the mother is killed; if by heavy rain storms the nest is flooded; if the prowling skunk or the thievish crow discovers its location, the life of our young quail will be a short and not a particularly merry one; he will never see the daylight.

Let us suppose him happily hatched, however. He starts forth with his brothers and sisters on his journey through life. The chances are ten to one that before three weeks have passed he will have been picked up by a bawk, or carried off some evening, just at dusk, by a soft winged owl, or captured as he passes some old pile of stones, by a weasel, or casually gobbled up by a fox while passing through the swamp. If he escapes all these dangers, if the weather during his days of extreme juvenility is warm and dry, so that he gets a fair start and plenty of strength before cold, harsh rains come to chill his small body and make him an easy prey to disease; if the larvæ of the partridge fly do not fasten on his poor little head and suck away his very life blood; if none of these things happen—and all or any of them are likely to come about—our quail has a reasonably fair chance of living for six or seven months, and finally being brought to bag in the approved and legitimate way. From a quail's point of view, however, his lot is not a happy one.

We have enumerated a few of the dangers to which some of our upland game birds are subjected, and which it is the sportsman's duty to diminish as far as in him lies. Bounties on hawks, owls, skunks and foxes, offered by gun clubs and game protective associations, would do much to lessen the number of these vermin, and, hence, to increase the birds in any district. Of all our hawks the common marsh harrier is one of the most persistent and successful destroyers of quail, and one of them will more than decimate a growing brood. All the animals mentioned, with the exception of the fox, may be readily destroyed either by the gun or trap, and a little well directed effort to this end would, we think, soon be repaid by the improvement in the shooting. But there is one enemy to bird life to which we have not yet alluded, although, in our opinion, it is no less destructive than all the others which we have mentioned. An enemy that hunts indifferently by night or day, in the deepest woods or in the orchard close to the house; a creature that does more to deplete the covey of quail, to destroy the woodcock, both old and young, and kills more insectivorous birds than all the hawks in a district; an animal that is the pet of the children and the favorite of the housewife. "What!" says some horrified reader, "you don't mean Yes we do. IT IS THE CAT.

A cat that lives in the house or in the stables and only makes occasional stolen visits to the woods and fields is bad enough, and destroys no small amount of bird life. We have seen such a cat-one that spent all its days ly-

ing under the stove, or in the warm sun, one that had such a virtuous and innocent countenance that you would have trusted it with untold pitchers of cream—we have seen such a cat, we say, start quietly out just at dusk, and return to the kitchen in less than ten minutes with advine woodcock in its mouth. From the stomach of another similar feline Pecksniff we have taken the larger part of an adult quail.

But house cats that only hunt occasionally are saints and martyrs compared with the domestic cat run wild or with the utterly irreclaimable descendants of these wild tame cats. Such animals have to depend solely on their own exertions for a living. With them hunting is a business as well as a pleasure. They are veritable pot hunt-

The English keeper well understands the injury done in the preserves by the domestic cat, and wages against it a war as bitter, and as uncompromising as that which he carries on against its short-tailed wild cousin, or against the stoat, or any of the hawks. A similar crusade should be inaugurated in this country by all who are interested in the preservation of our game birds.

The hunting grounds of the cat cover all the localities frequented by our feathered game. You may start them as well from the swamp where the cock are to be found. as from the hedges that border the rye stubble through which, at morning and evening, the quail wander. have come upon them peacefully reposing in the alder runs that we were working out late in the season for ruffed grouse, and have surprised them on the borders of the snipe grounds, at their meal on a green-winged teal or

Nowhere can they be found in more abundance than in the Central Park. Any one who may ride at dusk along the west side drive or bridle path will see Thomas and Tabitha, with all their relations, starting out on the war path. The rabbits and the many birds in the Park furnish them with a fat subsistence. Let us hope that Mr. Bergh's proposed anti-cat ordinance may abate this nuisance before long.

There is one way, and, so far as we know, only one, of curing a hunting cat of its fondness for what some of our contemporaries call the "noble art of venerie," we hope that, during the next season, all of our readers who may have the opportunity will give it a thorough trial. The rule is one which we invariably practice ourselves, and usually with the best results. It is this: when you see a cat while out shooting, approach it as closely as possible, aim your gun at the shoulders or back and pull both triggers.

It is time that the sportsmen of our country, and especially of the thickly settled East where cats do most abound, took some active steps to protect the birds from this enemy, the most destructive, after man, with which they have to contend. We are sure that, could the quail, the woodcock and the ruffed grouse speak, they would, if questioned as to the enemy of which they stand most in fear, reply in accents of horror and alarm :

"It is, it is the cat!"

And the great army of insectivorous birds, the friends of the farmer, the sweet-voiced warblers that cheer us through the spring and summer by their songs, and beautify our homes by their brilliant plumage, would take up the sad refrain, and, in tones whose pathos and earnestness could not fail to arouse the sympathy of every kindly heart, unite in uttering the confirmatory, the condemnatory, the now classic words:

"They're right; it is the cat."

BREEDING QUALL IN CONFINEMENT .- The experiment, so often tried, of rearing quail in captivity has never been thoroughly successful. The very few instances on record where quail have been hatched and reared in the cage are only enough to show that it may possibly occur in exceptional cases. We have often had quait lay in confinement, but never set.

It is said that Mr. Henry Benbrook, a game dealer in Raritan, N. J., succeeded in rearing six quail last year which had furnished him up to July 31st with 108 eggs. Some of these were placed under a bantam hen, and six young were hatched, which are alive and doing well.

The history of Mr. Benbrook's experiment is as follows: Four years ago he captured two quail and kept them in confinement. The first year the female laid twenty-four eggs, but declined to incubate; the second year was unproductive, but the third the female laid twelve eggs, and after setting for some time died. The male then took her place and brought off six young, which, as has been said, lived and are laying this season.

The further results of Mr. Benbrook's quail culture will be looked for with interest.

NEBRASKA FIELD TRIALS .- The Nebraska State Sports men's Association propose to hold a series of field trialsat their next annual convention at Milford, Neb., Sept. 30th, Oct. 1st and 2d. We are glad to see these trials multiplying.

-Among our contributors this week "Nessmuk" finds, in the pappoose, a subject for an altogether original study of Indian life, and "Bodines" continues his readable 24 Camp Notes.

#### THE AMERICAN-CANADIAN MATCH.

THE American victory over the Canadian team at Creedmoor, last Saturday, was not an unexpected event to either of the two teams. The visitors hoped rather than anticipated a victory, and that they had really made intelligent preparation is evident in the averages of 200 reached by them. In the long series of ternational matches there has never been one with less preliminary pother. It was a quiet, simply conducted display of fine shooting, such as American rifles and American riflemen are capable of making every day. Of course all this excellence, which seems to be so easily accomplished, really means a vast deal of preparation. To take a glance at the flags which flutter about on the staffs, judge from their motion the force and direction of the wind which is affecting them, and then express that force in turns of the vernier sight and windage screws, seems to be a very easy performance: but the ability to do so was only won by the gentlemen at Creedmoor last Saturday by days and weeks of practice on the ground Thousands of bullets were sent spinning down the range, the performance of each carefully noted, and then, from these data, the rules drawn, the conclusions reached which enabled such good results on Saturday last.

The match was a novelty in being without a referee. Each team intended to do its best fairly and honestly, and expected the other to do the same, and with this spirit prevailing an officer of supervision was a mere superfluity.

The Canadians went home with that measure of satisfaction which comes of a good deed gallantly performed. They had missed success, but they had deserved it, and, were the conditions of the Elcho Shield contests such as to admit a Canadian team, that trophy would no doubt oon take a transatlantic trip. They go back to the Dominion with the right, well earned, of being considered worthy antagonists of the Creedmoor shooters, and richly deserve the courtesy of a return match on their own grounds next year with their foes of last Saturday. It certainly does begin to look as though the prestige of American victory, which has now been held for six years, was to be broken by a Canadian team. They have that pluck which carries them through one defeat on to the next charge, and almost equal our friends the Irish marksmen for the vigor and determination of their bids for championship over the Americans.

The scores are worth study. On the Canadian side it will be seen that the shooting is well bunched, and that but a half dozen points separate the highest and lowest scores. On the American side the work is more straggling, but still there is no extensive gap seen. The marksmen there are not placed as one would suppose from their previous practice, but the secret is told in the report of the match, which attributes the high position of Mr. Waters to his implicit reliance on the judgment of his coach. Of course that gentleman is capable of making a creditable showing in individual shooting, but there is a certain element of strength in the advice and counsel of a good coach, and this was added in this case, giving the first place in the match. The valuable coach sits at the scene of action, and becomes, as it were, the reservoir of the experience of each shot, and from this fund of information properly digested the next member of the squad may draw. If he fails to do so, it is to his loss, and in the team of the future, when even more than now victory may depend on a single shot and its result, the office of the coach will be magnified, and the value of an efficient assistant in that position be duly recognized.

THE WIMBLEDON MARKING SCANDAL.—The develop ments at the late meeting of the British N. R. A., touching false marking, should be carefully conned by the managers of our Creedmoor meetings. It is the simplest thing in the world to secure a perfect system of checks in the sig.. alling of shots, while, at the same time, the marking could be prompt as now, with the record as effective in all respects. The target of to-day is far from being sensible in theory or practice, and there is an opportunity for some clever inventor to bring into existence the target of the future, which shall tell each rifleman instantly on the delivery of his shot precisely where it has struck and its value in a system perhaps less arbitrary than the present, and more discriminating without becoming more clumsy. It is not an inviting commentary upon the standing of the troop of the British Army to see them stooping to the taking of bribes in the fashion hinted at, and the very safe inference that 1880 has not seen the opening of the deceitful system only makes the scandal the greater, as it seems to throw doubt upon the performances of former years. There is need of more exactness when records are making on the rifle field, and some of the clubs over the country are far from paying much attention to form and order in the making up of scores. So derelict are some that their reports of practice bear strong traces of the amendatory pencil at the shooting stand.

Delaware Game Protection,-The heads of 1,769 hawks were returned to the Somerset Commissioners, at a cost to the county of \$884.50.

#### THE ANTHRACITE'S FAILURE.

THE most successful case of misrepresentation through the innocent instrumentality of the preswhich has ever come under our notice is that of the reputed economy in consumption of fuel of the Perkins system, or rather his adaptation of the pipe boiler and his special engine. It seems high time that the public were set right in this matter before they are wheedled into taking stock or investing in any "rights" for American

Everybody reads Forest and Stream. Major Deane, the secretary and agent of the Perkins Steam Engine Company, reads it, and the company itself anxiously looks for its arrival every week. After waiting patiently for an explanation from Major Deane relative to his astonishing want of familiarity with engineering as displayed in a letter of his to a reputable manufacturing concern recently, the Major cannot blame us for assuming him to be altogether a novice in such matters, therefore incapable of explaining away the serious blunder which has gone on record against him. We did not insist upon an answer appearing in this journal, and would have been perfectly satisfied had he seen fit to address his communication to any other publication, barring, of course, sundry infinitessimal sheets which are not generally recognized as fit mediums through which to discuss such important questions as the economy of fuel consumption. But the Major has remained silent, and it will now be our turn to speak and to place before the public some very unpalatable facts concerning the very peculiar management of the Perkins monomania in From the departure of the Anthracite from England

up to date, her affairs have been conducted in a manner at once ludicrous and wide of the truth, whether known or unknown to the persons in charge. Ludicrous, because the Perkins Engine Company seems to have regarded the American people and their engineers as so Zulus, capable of being readily reduced to the desired state of gullibility by the romancing of persons entirely unfit to speak intelligently upon the subject of her mission, leaving the source of information in no better hands than those of a hired fireman and a garrulous old Scotch engine driver. Wide of the truth, because Major Deane has exhibited photographs of yachts and ferryboats as examples of vessels using the Perkins arrangement, when every engineer in America is aware of the fact that both engines and boilers of those vessels have long ago been discarded and consigned to the scrap heap and spherical boilers with the usual type of compounds substituted. And further, wide of the truth because Major Deane has gravely expressed his confidence in some trials recently made at the Brooklyn Navy Yard, "because thorough experiments had been carried out on her in England with the result claimed of one horse power per hour per pound of coal burnt." And yet the results of the English trial have only been figured up a few weeks since, the accounts of the trial spread broadcast over here being purely assumptions, which the report to hand does not bear out, which it in fact directly The vainglorious assertion about "creating a revolu-

tion in engineering" is clap-trap pure and simple, for, as we will show, the boiler and engine of the Anthracite turn out to be not a whit more economical than the practice noted aboard any first-class ocean steamer when tried under equally favorable conditions. We do not wish to convey the idea that Major Deane wilfully circulated what he did not believe himself; there is no reason whatever to question his perfect good faith, but we hold that he has fallen a victim to the windy tales of those about him. The fact remains that these stories were allowed to pass into print, and that the press has become the innocent means of disseminating misleading news through the failure of the Perkins Company or its agents to contradict what some of them must know to be false and an imposition. The whole thing smacks strongly of an advertising dodge, and shows that it is still an easy matter to gull the lay press, providing the romancing be brazen enough to partake of the sensational. In view of the facts herein contained, many esteemed but too gush ing contemporaries will have some trouble in "craw-fishing out o' de hole," and "crow" ought to be their prevailing food until the visit of the Anthracite shall have been forgotten, and her hideous outline faded from public memory.

The Perkins Company made a grave mistake in sending out persons in its interests who are not engineers, and those persons made another grave mistake in seeking counsel and championship at the hands of ignorant indi-viduals whose names are born on prison books, in place of directing themselves to sources more reputable and more capable. The Perkins boiler will never be adopted in America; it will not even be introduced; it is not worth it. As for the Perkins engine, we cannot bring ourselves to speak of it in serious language.

Concerning the recent trial at the Brooklyn Navy Yard, the wordy versions of success are empty of facts, and have no other foundation than a reporter's imaginative brain. Nothing has yet been determined, only a number of indicator cards have been taken. That a essure of 300 to 500 pounds steam could be carried in the Anthracite's boiler, or in any other pipe boiler built for such pressures, is not a point at issue at all, is nothing new and not worth recording. The trials in England have been shamefully falsified to affect the public here, and we protest against any similar tactics being countenanced on this side of the Atlantic through the inability of the non-professional press to deal with matters which are beyond it.

In order that we may not be accused of prejudice, we prefer to give the investigation of an English journal, the standing of which is as well known to us in America as it is to the fraternity in Europe. We quote from the London Engineer, July 30th, which bears us out with data and facts in all we have said concerning the Perkins hobby. It also gives color to the prevailing impression that the Anthracite shirked a test with the steamer Leila for causes much more rational than the foolish and untenable reason assigned by the company's agent in his unfortunate answer. The Engineer has it as follows:

We have been favored with a copy of his report, which, tor some inexpelicable reasons, is very incomplete; in fact, any as-sistant engineer could have produced one as satisfactory. It will be borne in mind that for a great many years Mr. Perkib we carnestly advocated the use of very high pressure steam and large measures of expansion; and that he has stated and argued inge measures of explasion, and that no has stated and agreed that in this way, and in this way only, can any great economy of fuel be obtained. It has been urged, on the other hand, that Mr. Perkins never had hald a proper test of one of his engines mady; or that if such a test had been earried out that the result had not been published; that the engine was o-smplex, and unsuited for been published; that the engine was complex, and unsuited for usear sea; and that sound theory, read in the light of the best practice, was dead against Mr. Perkins. We may add to this that all Mr. Perkins' ventures at sea have been singularly unfortunate. The engines of the yacht Wanderer, which were intended once for all to establish the success of the Perkins system, broke down, caused much trouble, and were finally condemned and removed. The engines of the Loftus Perkins, to which we referred above, have, it is said, gone to the scrap heap after a few months' service, during which, it is currently reported in Sunderland, that more time was spent in the making of repairs than in the running of trins. Almost the only congenious made by Mr. Bramwell more turies. Almost the only comment made by Mr. Bramwell into of trips. Almost the only comment made by Mr. Bramwell is to the fellow that the engines ran for ten hours without re-quiring the set of a hammer or a spanner, which Mr. Bramwell seems to consider a remarkable performance; but whether re-markable only for the Perkinsengine or for any engine we canmaranno bony four ferkinsengine or 10 rd any tegina we can-not say. See going engineers will hardly took on it as an excep-tional feat. Mr. Braunell made no attempt to determine the evaporative efficiency of the boiler. He contented himself with taking 12 diagrams, and weighing the coal; 15 cwt. were himself in all. The engines gave out from 7.20 A.M. to 6.30 r.M., eleven in all. The engines gave out from 7:39 A.M. to 6:30 P.M., eleven hours and ten minutes, a gross average indicated horse power of 80.55, but from 6:30 to 7:25, when the engines stopped of themselves, because the fire had burned itself out, the nower was gradually diminishing. The average full power revolutions were 130.77 per minute. The average consumption of fuel per horse per hour was 1.7 pounds, including that used in getting up steam. "From that time," writes Mr. Bramwell, "when the first shoviful of the fourth sack of coals was put on the fire, namely, at 7:51 A.M., to the time when the first shoveful of the fitteenth sack of coals was put on the fire, among the first shoveful on the fitteenth sack of coals was put on the fire, among a first part of the fitteenth sack of coals was put on the fire, among a first part of the fitteenth sack of coals was put on the fire, among a first part of the fitteenth sack of coals was put on the fire, among a first part of the fitteenth sack of coals was put on the fire among a first part of the fitteenth sack of coals was put on the fire, among a first part of the fitteenth sack of coals was put on the fire among a first part of the fitteenth sack of coals was put on the fire among a first part of the fitteenth sack of coals was put on the first shovelith of the fitteenth sack of coals was put on the first shovelith of the fitteenth sack of coals was put on the first shovelith of the fitteenth sack of coals was put on the first shovelith of the fitteenth sack of coals was put on the first shovelith of the fitteenth sack of coals was put on the first shovelith of the fitteenth sack of coals was put on the first shovelith of the fitteenth sack of coals was put on the first shovelith of the fitteenth sack of coals was put on the first shovelith of the fitteenth sack of coals was put on the first shovelith of the fitteenth sack of coals was put on the first shovelith of the fitteenth sack of coals was put on the first shovelith of the fitteenth sack of coals was put on the coals was put on the fire, namely, 4:55 F.M., f. e., eight hours fire-five minutes, the engines exerted an average of 80,9 horse power. This gives the consumption per horse power per hour at 1.7 pounds, assuming the fire was uniform at the commencement and end of these times."

In the first place, the power developed was sufficiently great to make the experiment a satisfactory test of the Perkins system. The cylinders were jacketted, and there were no leaks, and the make the experiment a satisfactory test of the Perkins system. The cylinders were jacketted, and there were no leaks, and the boiler was so efficiently clothed that a thermometer laid on the lagging and covered with cotton wool only rose to 18 degs. Fahr. It is improbable, therefore, that any better result could be got from a large engine. Next it is to be observed that the fuel used during the trial was "Nixon's navigation land-picked humps," which is probably the best coul in the world. Experiments carried out with it at Keyham yard in 1853 showed that it evaporated, when burnt properly, at the rate of 11.65 pounds of water from 212 degs, while the best Newcastle coul in the some boiler evaporated but 9.31 pounds. It is a curious fact that Mr. Bramwell, in his report, nowhere states the temperature of the feed-water. We may assume, however, that it was the same as that of the condenser. The vacuum was 27 inches. The beight of the barometer is not stated. Taking it at a little under 30 inches, we have 113 degs, as the temperature of the feed-water. We have 13 edgs, as the temperature of the feed-water. We have 13 degs, as the temperature of the feed-water. We have 13 degs, as the temperature of the feed-water. We have 13 degs, as the temperature of the feed-water. We have 13 degs, as the temperature of the feed-water work of the same as the same consumed 1.5 pounds, or say, in round numbers, 19 pounds of steam per horse-power per hoir. Now, it may be regarded as clearly proved that ordinary compound engines working on north country coal norse-power per nour. Now, it may be regarded as clearly proved that ordinary compound engines working on north country coal require but 1.9 pounds to 2 pounds of coal per horse per hour. Making allowance for the difference of the qualities of the boilers and of the coal, we may say that this represents 19 pounds to 22) pounds of scena per horse per bour; or to all intents and purposes the engines of an ordinary Atlantic care, it is not the property of the coal per horse problem. or to an intents and purposes the engines of an ordinary Atlantic cargo steamer, indicating from 31) to 407h horse power, are as economical as the Perkins engine. We are dealing here with facts. We are making no assumptions. The consumption of steam in the engines of the Anthracite was more like, y to have been greater than we have stated than less. Indeed, we believe been greater than we have stated than less. Indeed, we believe that Mr. Perkina claims that his botier can evaporate with the best Weight coai, and feed-water at 120 dega., nearly 12 pounds of water per pound of coal. This would make the consumption of steam 20 pounds per horse. Comparing the performance of the engines of the Anthracite with those of ordinary compound engines by good makers, we find that nothing has been gritted by the adoption of a high boiler pressure. We say boiler pressure, for, curiously enough, Mr. Perkins does not really work with steam of enormous tension, however much he may advocated; Thus, while the boiler pressure in the case of the Anthracite was 280 nounds on the surger inch, the pressure in the first eviludes. 250) pounds on the square incl., the pressure in the flat cylinder did not exceed 180 pounds, or just one-half that in the boiler. We are entirely at a loss to explain what object is gained by ear-yrjing 500 pounds in a boiler and working at 180 pounds. As or does MR. Bramwell throw the least light on the subject. Indeed, there are many points of much interest left totally untouched in this curiously incomplete report. Thus, we should have liked to know how much steam was condensed in the colled pipes which acts jackets to the cylinders. Again, we are told nothing about the temperature of the sea or that of the feed-water; and, as we

have said, no attempt was made to measure, the feed-water. We navesan, no attempt was made to incasure the receivance. We reproduce copies of three of the diagrams—that is to say, a set. It will be seen that while the first two diagrams are good and satisfactory, the two last are very much the reverse. The diagrams are all alike, right through the series, and we have no doubt that the jump at the beginning and the wave line are due to condensed the jump at the beginning and the wave line are due to condensed steam. The engines, during the trial, expanded steam thirty two times, and under any possible conditions, unless the steam is very highly super-heated indeed, that ratio of expansion must be attended with enormous condensation. The piecing of the two tended with enformous condensation. The precing of the other dis-params is fairly good, but that of either of the other dis-grams with the second is very bad...
We, and many others with us, would like to be told why the cylinder pressure was but one-half the boller pressure. One hun-

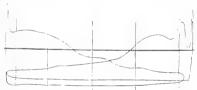

dred and sixty pounds is by no means unknown in locomotive practice, and if very high pressures are good, why does not Mr. Perkins use them? It may be of course that he considers an expansion of thirty-two to one enough, and that if he sent 393 ands of steam into his engines he would have to expand it too pounds of steam into his engines he would have to expand a room much. Conceding the force of the argument, the question re-mains, Why does he earry 300 pounds in his boiler? If it con-duces to economy, the fact ought to be generally known. It will a new fact to most engineers.

We should say so.

When Mr. Perkins was content with two cylinders, he obtained one horse power from 1.6 pounds. added a third cylinder, "to do away with a gland," the best his arrangement could do with the best of coal was 1.7 pounds, which is not calculated to inspire faith in the claim of the Perkins Engine Company to teach world anything new. 'The reader will probably conclude with us, that the advantages claimed for the Perkins system are a myth, and that trying to place it on the American market at this late day seems little less than grotesque. We subjoin the diagrams referred to :-

Steam, 35 lbs.; chamber, 9 lbs.; vacuum, 26] ins.; revolutions, 128; per minute. For the high pressure cylinder, the average -123 75 lbs.; for the intermediate cylinder, the average -15,72 lbs.; For the high pressure cylinder we have 3,569 revolutions X:70X123.7-28215,227 foot lbs. For the intermediate cylinder we have 3.5.6 revolutions X:238.05X15.8-14,540.760 foot lbs. The first diagram is from the top of the high pressure initial cylinder, the second from the bottom of the second cylinder. The remaining two are from the top and bottom of the third cylinder, as fol-

Average for low pressure cylinder, bottom = 10.47 lbs., and for the top -8.153 lbs. We have, therefore, for the bottom 3,895 revolutions X993.49X10.47 = 20.378.699 foot lbs., and for the top 3,890.X51c.,88XS.1.1-8,029,913 foot lbs. Total foot lbs. = 7231,590. All the diagrams are calculated with the planimeter. The last pair were however, very unsatisfactory and difficult to deal with, the wave curve line being apparently due to the presence of water in the

ROUGH NOTES FROM THE WOODS.

Second Paper.

BY NESSMUK,

NY NESSMUK.

POUR miles from Moose River, on the "Brown Tract road," there is a trail turning to the right, and a white shingle is marked "Jones' Camp," Follow the trail two miles, and it forks. The left fork is marked again "Jones Camp." The right fork has a plain shingte, marked with blue pencil, as follows: "Wn. Bero, Chief St. Regis Indians." This trail leads to the "Injun Camp," as it is called here. I had met Chief William at the Moose River House: had been told that he could give me more genuine knowledge of the wilderness than any man within fifty miles. I laid myself out to cultivate Chief William, invited him to my room, showed him rifle, hatchet, fishing duffle, hooks, spears, lines and knives. When I showed him an ivorylandled Spanish knife that was really fine, though of had myself out to chitriate chief winning, invited man by sensy toom, slowed him rifle, hatchet, fishing durile, hooks, spears, lines and knives. When I showed him an ivory-handled Spanish knife that was really fine, though of little use to me, I saw his black eye gleam; he fell in love with that knife on sight. I am well used to the American aborigine. When William had done admiring that knife I made him a present of it. That won him. I am sorry to say I supplemented the gift with a glass of firewater. A cordial invitation to visit the Indian camp followed, with an offer to carry my canoe and all the traps I desired to take.

William Bero, chief of the St. Regis tribe, heads a gang of twenty young braves, whose tomahawk is the axe of the backwoodsman, whose scalping knife is the spud of the backwoodsman, whose scalping knife is the spud of the backwoodsman, whose scalping in, I met William on the trail, who, with a companion, was going into the tamery on business.

He went no further. He had promised if L came out to his camp that he would "take care of me," and he did it.

Relegating his business to his partner on the spot, he took my blanket roll and ritle away from me. He even insisted on carrying my niae-ounce rod. From the moment I met him on the trail he took possession of me, so to speak, and I followed his lead implicity. What a grand woodsman the fellow is! I wanted to go to the Indian camp the first thing. Not a bit of it. He knew of a spring hole that he wanted me to fish, and I surrendered. He led me by trails and across swamps, until I lost all notion of compass points, and at last brought me out on the banks of the Moose, at the mouth of a cold troutstream, and then he explained that trout had been taken there the present season weighing over three pounds. I dare say he was right. But as they had been taken, of course they were not there.

I whipped the water in my best style for half an hour without a rise, while Chief William, with tamarack pole, coarse cotton line and large bass hook, baited with a clunk of shiner, stood on a log below me and hauled out trout after trout in the most business-like and unartistic manner.

throat after trout in the most business-like and unartistic manner.

At last an unfortunate took my center fly—a queen—and, as I was towing him around, another victim inmolated himself on the tail fly—a Romeyn. It was well, With what trout Chief Bill had snaked out we had enough, but it is hard to make any man here believe that you come to the woods for any other purpose than to catch the ultimate trout and shoot the list possible deer, I succeeded in drawing Bill off, and we started for the "Indian camp." He said it was "a mile 'n half." I think it was. It took an hour and a half of rapid marching to reach it. The camp was simply two batk-roofed log shanties, standing among and underneath large spruce and hemlock trees. and hemlock trees,

shanties, standing among and underneath large spruce and hemlock trees.

One of the whirlwinds so common in these woods would make a bad tangle of that camp.

The immates of the shanty consisted of the fifteen choppers and peelers, with Bill's family of seven—Mrs. Bill, a portly, comely squaw; the daughter, a pretty-featured, plump young squaw, with a voice like a silver bell, and four young Indians, the smallest being the inevitable pappoose, on his ornately carved and painted board.

That pappoose is and always has been to me a sybilline mystery. I first made his acquaintance many years ago among the Nessmuks of Massachusetts. He was on his board, swathed, strapped and swaddled from chin to toes, immovable save that his head and neck were left free to wiggle. I next saw him among the Senecas of New York State. Then in Michigan; in Wisconsin; on the upper waters of the Mississippi; and now I meet him again in the North Woods. The same mysterious hiscrutable eyes; the same placid, patient, silent baby, varying in nothing save the board, which in Wisconsin was simply a piece of bark. In this case the board is a neat bit of handicraft. When Bill assures me that the carving was "done with a jacknife" I can hardly believe him. And when he says that the bright vermillion, blue and yellow has not been retouched in thirty-five years, I don't believe him at all. The painting is as bright as though it was put on the present season. Commend me to the pappoose board. We judge men, actions and things by ultimate results.

After a royal supper of trout, cooked in a manner worby ultimate results.

by ultimate results.

After a royal supper of trout, cooked in a manner worthy of Delmonico's, I watched Bill's young barkpeelers as they got red around a rousing fire which they had the good sense to build under a huge hemlock. There was not a pair of round shoulders or a protruding shouldershade in the camp. Straight, strong, stalwart fellows, one and all. And every man of them spent the first year of his life on a pappose board.

It has been said a thousand times that Indians will not work, or only in a fitful, desultory way that amounts to nothing; and this is true of the plains Indian; also of the Cree and Chippewa, with other nomadic tribes; but not of the St. Regis or Mohawk, and only in part of the Senecas and Oneidas.

As an instance of what Indian muscle can do, let me

Cree and Chippewa, with other nomatic, tribes; but not of the St. Regis or Mohawk, and only in part of the Senecas and Oneidas.

As an instance of what Indian muscle can do, let mestate that the day before I reached the St. Regis campten of Bill's barkpeelers felled and peeled 138 large bemlocks, yielding over thirty cords of bark. In most white camps a cord of bark per day is accounted fair work.

I think the pappose is glad when darkness settles down on the forest and they let up on him. He throws his arms and legs about for all the world like a white baby, and crows like mad; then of a sudden his head lops over; he is asleep. I, too, turn in, but not to sleep. Three of the young Indians, including the sweet-voiced maiden, gather around the fire and sing in a low minor key, and with soft, pleasant voices, the Indian songs of their tribe. And at last I drop into slumber, and waken five minutes after, as it seems to me. But it is daylight, and Mrs. Bill has the breakfast nearly ready. I have slept the sleep of the just man, and am fresh for the day.

The maiden has got that inscrutable pappose out, and is strapping him to his board for the day. When they get him thead they will pall out from under the roots of a lunge hemicok the inevitable jug of tar oil, and annoint every visible part of his tawny pelt. The tar oil, well applied, will last some two hours, when it begins to fail, and venomous insects begin to wire in on you.

That pappose understands it. So long as far oil lasts he spends his time peering with deep, curious eyes into the gloomy depths of the forest, or, when the wind rises watching the swaying tree tops. But at the first decided mosquito or punkle bit he gives tongue in a straight, steady yell, without any ups or downs, and Mrs. Bill comes to his relief, takes him between her knees, announts him from neck to crown, takes him by the basket handle of his board, as one might a peek of potatoes, and stands him up against a hemlock, a log, or the shady side of the shanty. He resumes his eternal occ

An Indian baby is not expensive in the way of play-

An Indian baby is not expensive in the way of playthings.

Chief William gives me no rest. It is his undying conviction that I came to the woods for the sole purpose of shooting deer and catching trout, and I have got to do it. He hurries me off to Nelson Lake, one of the unmapped waters of the wildeness. There are three spring holes there, in which trout of two pounds have been taken the present season. It is also a good lake for "hoating," as they call it here. A short time since a party went on the lake to float, and succeeded, by noisy paddling, in scaringsix deer out of the lake in one evening, but got no shot. I find Nelson Lake a pretty sheet of water, fringed

with the fragrant pond lily that is almost universal here. Bill lays me up to the first spring hole without noise or wake, and I cast my thes across the clear, cold water in vain. Chubs and shiners rush madly on the hooks, but trout will not rise. Bill takes a shapeless piece of chub, puts it on that hook of his, and presently drags out a pound trout. To say I am disgusted is putting it mildly. I am swearing mad. He explains that there is a time late in July and early in August when trout "lay deep" and will not rise to fly. "If we had wums," says Bill, "we catch 'em." That is just my idea, and it happens that I have the "wums." Brought them with me, knowing they were not to be had in the forest. While he is paddling to the next spring hole I take off my leader and replace it with a large hook and strong snell, bait is heavily, and make a cast as the boat glides slowly within reach. It is taken on the first cast, and I bring a half-pound fish into the boat with small ceremony. Bill catches, as usual, a larger one, and then I stubbornly refuse to make another cast. He does not understand it at all, but paddlest ot the landing and I walk up to camp, scrape acquaintance with his daughter, who is educated, intelligent and a school teacher among the St. Register and writing English fluently. She showed me specimens of chirography, and was pleased when I praised her handwriting, which was readly fine. Then I took the pappoose by his basket handle and carried him off into the woods. I stood him up against a spruce and made him a speech in mixed Chippwa, Portuguese and English. Lexplained to him the day was placed my forefathers and foremothers. I brandished a big knife about his bady head, sang a snatch of Chippwa war song and gave the war whoop.

into the woods. I stood him up against a spruce and made him a speech in mixed Chippewa, Portuguese and English. I explained to him the brutal manner in which his ancestors had roasted and scalped my forefathers and foremothers. I brandished a big knife about his baby head, sang a snatch of Chippewa war song and gave the war whoop. A white baby would have gone into convulsions. He looked at me calmly with those dark, fathomless eyes, and when I gave a final whoop, broke into a placid smile that covered his face all over like a burst of sunlight.

An Indian baby doesn't seare much.

After a dinner of trout—again—Bill left me in peace, while he went to look after a bark job somewhere among the hills, and I took my blanket, hunted out a dry, cosynook, rolled myself up and was having a grand snooze, when I was awakened by some one calling my name. It was ye Chief Bill, and I knew he meant business. He is bound that I shall have sport, if it kills me. We are to fish that sprung hole again, which I don't care for, and then watch a deer lick, which I do care for, He straps on that everlasting pack-basket, gets out his shooting gear, and leads off again, but by a shorter route, to the same spot I fished the night before. I am sorry to see that Bill's shooting-iron is a veritable old musket of the Continental pattern, from which two of the three bands have been abstracted to lighten the piece. He excuss himself for carrying such a clumsy concern by saying that it is the best barrel to throw buckshort that he can find, and he likes a buckshot gun for floating or lick-watching. When I see him load it with about forty grains of powder and elevens small buckshot flose faith in him, rather. At the spring hole it was the same old story. The chief caught two me trout: I landed one. I retused to throw another fly, and began to pack up to Bill's disgust and surprise. I explain we have plenty of fish for the rout supper which he has planned, and by the time that is over it will be time to climb up to the bind to the wond and beto

render the North Woods a terror and a torment to tourists, sportsmen and naturalists during the summer months. This is probably the country to which Mr. Tennyson refers when he sings of a land "Where each man walks with his head in a cloud of poisonous flies." They are nothing to me. I walk among them through these grand forest aisless safely as in a nunnery. This paper is too long already. If I tinds favor I will in my next give a simple recipe by which any one can flank punkies, mosquitoes and even the black fly.

Foot of Stillwater, Jones' Camp, (Have lost the date.)

ADIRONDACKS.-Springfield, Mass., Aug. 11th.-Several ADRONDACKS.—Springfield, Mass., Aug. 11th.—Several of the Beaver River Club are going to the North Woods soon, and I will report when they come back. I received a kind invitation from Class. Fenton, Esq., of Warson, Lewis County, Number Four, to come up and stay with him, but am obliged to refuse. He says he has now seventy-seven boarders, which with his servants and family make about one hundred at his house, and he has refused scores of applications for want of room. Twenty-five slept in his barn one night, for want of room at the house, which goes to ehow how popular the North Woods are for recreation. But I think it is sad for us hunters, as game and fish must become scarce. In fact, I see a great change since my first trip into that region. F. B. CAMP NOTES.

BY EODINES

I PROMISED to tell you how we live in camp. Let me commence by describing our grounds, and the preparations we have made for resting in the woods. We are on a narrow point of land that is completely

ireparations we have made for resting in the woods. We are on a narrow point of I and that is completely shaded by the widely reaching branches of two immene beech trees and an equally stately elm. At the extreme point are two tall pines, leaning to the right and left, affording us a view of a long and quiet pond that nestles at the toot of a bigh and densely wooded mountain. On both sides of our grounds, so near that they can be touched with a fishing rod, are running mountain streams, clear and sparkling. To our right a deep pool—where the trout delight to splash when the sum has disappeared behind the western mountain—its shore ornamented with moss covered rocks and boulders, from between which are growing ferns and blooming rhododendrons. Above them all, a mountain road, where voices are now and then heard in praise of the beautiful camp below. To our left, the stream, then a clump of willows and beyond a meadow, which is lost in the dense forest and surrounding mountains, shutting us in so that but little sky is seen, and where the sun has but slender opportunity to oppress us with his mid-day beams.

At the extreme point of the camping grounds, where

and beyond a meadow, which is lost in the dense forest and surrounding mountains, shutting us in so that but little sky is seen, and where the sun has but slender opportunity to oppress us with his mid-day beams.

At the extreme point of the camping grounds, where the two streams never to form the long pond below, and between the two leaning pines, is constructed our firplace, made by electing a stone wall four feet long and eighteen inches high, with shorter walls at each end in tersecting it at right angles. The stones are covered with sooks and ciny, and over the top is laid two parallel iron hars upon which rest the coffee-pot, boiling feettle and frying pans. This arrangement is a great economizer of wood, and, when a good bed of coals lie under the bars, a affords a cooking stove that permits us to present an elaborate bill of fare. Here we broil steak and lamb chops, fry fish, boil potatoes, bake flap-jacks—and what sport it is to flop them over l—stew canned vegetables; in short, perform any of the entinary feats that we are in the habit of seeing in our kitchens at home. In our "dutch oven "are baked biscuit, johnny-cake, fish, beef and beans, in a manner, too, quite enjoyable and surprising as well to our city visitors. Our party is one believing that good, wholesome food, and plenty of it, is not inseparable from a camping-out expedition. We see no reason why we should not live as well, here in the woods, as at home, so we keep our larder well stocked with meats and other conforts obtained from the city twice a week. In the bank next to the mountain we have excavated a place large enough to receive a box four by six feet and four feet high. It is covered with sods, and has a door upon its uncovered side next to the creek. This is filled with ice, procured from the farm house close by, and here we keep our meats, butter and other perishable commodities. Next in order comes the dining-room, consisting of a canopy under which stands a table of ample dimensions, rustle in design and build. Four benches a da e soldered together by a narrow rim that unites their edges, leaving a half inch cavity between. In the rim, et opposite points, are two half inch holes, with a collar, in which corks are fitted. At used time these corks are removed and boiling water poured into one of the openings while the air excepts at the opposite one. The corks are then put in place, when, for an hour or longer, you have plates too hor to handle without napkins, keeping your food as hot as when removed from the fire until the meaning while the same manner, from which meat and regetables are served. The plates being too hot for but ter, smooth, round stones are used for individual ter, smooth, round stones are used for individual ter, smooth, round stones are used for individual cannot be succeeded to the same purpose admirably. Under the edge of the canory, so as to be shielded from the rain, are arranged two large camp chests, in which our provisions and utensits were transported hither. They now serve as cupboards. One of the chests contains large, square the cans (fancy camp chests, in which are kept flour, corn meal, rice, coffee, tea, dried fruit, sugar, etc.; in the other is stowed away the bread, crackers, dried beet, pickles, baking-powder, candles and the like.

Back of the dining-room, and further up the slope, under an immense birch tree, is pitched a wall tent which serves as a kind of store-room for our trunks and extra clothing; and, back of that, the large tent, 16x20, and 9 feet to the ridge pole, upon one side of which bunks are built and covered with ticks filled with straw. Over these ticks cotton-tilled quilts are spread, and over them sheets and blankets, affording a bed that would be quite desirable in more pretentious quarters. The remaining portion of the floor is covered with mex-movn hay, with hasocks lying about inviting a fellow, when so inclined, to a loung upon the fragrant floor. The sides of the tent have pockets in which pipes, tobacco, magazines, papers, needles, thread, buttons, and sundry articles of

are growing and blooming the various wild flowers indigenous to these woods. The paths are thanked by terms in
mounds covered with mosses and delicate vines, surround the trunks of the trees; the floors of the disinghall and kitchen are swept clean, and all our surroundings in the neatest possible trim; and this is our mountain home, where every year wespend the mouth of June.

In former camp notes, I wrote what we did when it
rained; let me now give you a sample of a bright and
clear day.

This norming we were awakened at 5 o'clock by the

In former camp notes, I wrote what we did when it rained; let me now give you a sample of a bright and clear day.

This morning we were awakened at 5 o'clock by the singing of the birds, and the bright light of day shining through our tent walls. The music outside, the clear, balmy air, and the prospects of an unclouded sunrise, were irresistible. A fellow could not lie abed if he would; so, as if by general consent, all the campers were found assembled by the shore of the creek, performing their ablutions and looking skyward, all faces lighting up for the application of the clear, cool water, and the prospect of a perfect day.

George had already builded his fire, the tea-kettle was sending a cloud of vapor from its mouth, while the lid over the potato-boiler was dancing at a lively rate. The table was set, the trout sissing in the big pan, and George vigorously stirring a quantity of batter that would soon be converted into flap-jacks. As we were chatting about the table (to which we had been summoned by George, who had converted the empty fish pan into a gong by beating it with an iron spoon), the sun made his appearance over a notch in the eastern mountain—right on time—indicating 6 o'clock. What a delightful breakfast we had there in the cool morning air, listening to the wardlings of the birds, and watching the sunbeams dancing over the rippling water and upon the trembling leaves of the trees, while squirrels and chipmanks climbed out upon the overhanging limbs looking inquisitively under our canopy to see what we were up to. Butterflies, bumblebees, and insects of various colors and forms were flying about helter-skelter, without any special object in view, save to enjoy the glorious norning. A boy, on horseback, rode along the mountain road overhead driving cows to pasture, singing merrity the while to an accompaniment of the lowing animals that made the mountains ring with their deep, base voices. Every note from man, animal, bird, insect or machine, seemed to ring out with a clearer tone, intensitied

passed.

Breakfast finished, we smoke. Then, some of the party paddle on the ponds; others go in search of birds and flowers; the boys make overs in the sand across the creek, and those inclined go fishing.

Breakfast finished, we smoke. Then, some of the party paddle on the ponds; others go in search of birds and flowers; the boys make ovens in the sand across the creek, and those inclined go fishing.

I being one of the "inclined," took down my rod from its rack against the beech, buttoned a landing net on my back, shouldered my creel and walked leisurely up stream to where I pricked a fine fish the day before. I must cross the creek, and, not wishing to get wet before I reached the fishing ground, attempted to pass the swift running water over a fallen tree, that reached from bank to bank. This tree was wet from the spray that arose from a boulder, against which the current splashed beneath, and was quite too round in form to permit of an easy or secure foothold. Reaching the center of this rustic bridge by means of two rheumatic feet and sunday and multitudinous balancings of arms and legs, a contounded kingtisher flew just under my nose, and, with an unearthly chatter, startled me, at which I lost my center of gravity and fishing-rod at the same moment. In trying to regain the first, while the second floated swiftly down the rapid and took lodgment in some willows, you might have witnessed, had you been there, some difficult feats in grotesque posturing. One moment I had decided to go in on the upper side of the log, but instantly changed my mind and center of gravity for the lower one; and then, when my arms flew about like those of a windmill. I hesitated and wondered until no living mortal could have decided for me. Another ship, a unique bend of the back, a thrust of the hijs backward and shoulders forward as well as a keen and much amused spectator on shore, which side of the blamatre would ultimately be selected for the plings. At last a decision was reached, when I took an intermediate course, and sat down with most consummate skill and great alacrity with a leg upon both sides of the blamatre would undered another the sparking gems larked and about me. This celestial phenomena lasted until gently slid

#### RITERS BIT.

I'T happened to us one day some years ago to find swimming in a small fresh water pond a carp duck or broadbill (Fulignla marila), which was unable to fly, although apparently sound in all its members, and which we succeeded finally in capturing in a landing net. It was observed during the pursuit that the bird was apparently unable to close its bill, and as soon as it was taken in hand the cause of this became evident. In the back of the mouth was the shell of a large mussel, partly opened, the hinge being toward the bird's body. The valves were still united, and their planes were at right angles to those of the bill. Between the united valves the posterior upper surface of the thick fleshy tongue was wedged in so that it was impossible for the bird to expel the shell from its mouth. The mussel was a large one, so large that there was no possibility of the duck's swallowing it. It was evident that the duck had attempted to swallow the mussel while it was open, and that after it had been taken into the mouth, hinge first, the latter had partially closed, grasping the tongue, and thus sealing both its fate and that of its captor. The mussel had been dead some time, for it had altogether disappeared from the shell, and the poor bird was woefully emaciated and died the night of its capture. This incident, rather unusual and interesting as it is by itself, becomes more so when compared with a number of similar occurrences which have from time to time been placed on record,

Most of us have heard the story of the raccoon which went ovstering at low water, and in trying to pull one of the bivalves out of his shell got caught by the foot and was drowned by the rising tide; and there is a egend about a darkey who was captured in the same manner, though his adventure did not have any serious termination. In the columns of Land and Water there have at different times within the past few years been published some instances of the capture and death of birds and fish by their supposed prey, which will, we think, be of interest to our readers in this connection. One of these relates to the capture of a small fish called a shanny, by a mussel, and is told in the following lan-

a shanny, by a mussel, and is told in the following language:—

A correspondent, Mr. Stephen Clegg, lately kindly forwarded us a box containing a shanny and mussel, which he describes as having been taken in the harbor at Looe, Cornwall, in exactly the position represented in the accompanying illustration. The shanny and mussel, our correspondent writes, were taken by a fisherman who was gathering mussels for but at Looe. Mussels are found in great numbers at the bottom of the harbor there, and the fishermen use a long-handled, four-pronged fork for eatching them. A boat is moored over the spot on which the mussels are to be found, and the fork is employed to bring them from below into the boat. In the case in question our correspondent assures us the shanny and mussel was brought up as shown in our illustration. The fish was alive when taken, and its head firmly fixed in the mussel. This certainly may be considered a curious capture, and from the evidence it may be fairly assumed that the shanny seeing a tempting mussel with its mouth open was induced to pop his head in—an operation which flaster Mussel doubtless resented by immediately closing its valves, retaining the fish in its deadly grasp. A case in point of fish being taken in this way is mentioned by Couch, in which Lacepède records an instance where, as he (Lacepède) supposes, a shanny had made an attempt to feed on an oyster that lay with its valves open, in consequence of which it became shut up a prisoner by the closing of the shell. In this condition of confinement the fish had continued so long that the oyster had been dredged and carried to a considerable distance. Upon opening it, the captive was again set free alive, and without injury. Shanny are very retentive of life, and would be found nice additions to salt water aquaria.

Another case bearing more directly on the one which

Another case bearing more directly on the one which came under our own observation, was spoken of by Mr, Buckland some years previously. In this instance a rail was caught by an oyster and drowned. Mr. Buckland

Some time since, when examining the famons cyster bed at Helston, near Falmouth, Mr. Frel Hill, of Helston, was kind enough to accompany me and my friend, Mr. Howard Fox, of Falmouth, in our expedition. Mr. Hill mentioned to me at the time that he had a curious specimen of a bird that had been caught by an oyster. The bird and oyster had been mounted in a case by Mr. Vingar, of Penzance. The history is, that a woman who sells oysters, went one morning to the Helford River and found the bird—a common tail—quite dead, with its beak held quite firmly by the oyster, which was still alive.

The bird in all probability was wandering along the foreshore looking for his dinner, and Mr. Oyster—possibly left longer by the tide than usual—was opening his shells waiting the incoming water. The hungry rail, seeing something that looked like a white and dainty bit of food, pecked at the body of the oyster, and probably pricked him sharply with his beak. The oyster then snapped his shells together as quick as a rat trap, and the poor bird instantly became a prisoner, to die (or possibly

ed his shells together as quick as a rat trap, and the or bird instantly became a prisoner, to die (or possibly drowned as the tide rose) in his prison.

Mr. Buckland's paper seems to get more than its share of such instances, for in a recent number we hear the story

of the choking of a grebe by a fish called a miller's thumb, which is provided with sharp spines on each gill cover. somewhat as are our own catfish. These spines caught in the throat of the bird and rendered the swallowing or disgorging of the fish impossible. We have never, by the way, been able to understand just how it is that birds and fishes can prey upon the catfish. Their rigid spines, one would think, might protect them from any enemy, and vet we constantly find catfish in the stomachs of fish, and not infrequently in those of birds. It is but a short time since a Florida correspondent sent us an account of a large catfish attacked by a heron, and mentioned find-ing the spine of one of these fish in the throat of another. We have found small cats in the stomach of a loon, and they are no doubt devoured by other birds. It may possibly be that after death the spines relax and lie flat by the side, but we do not remember to have seen anything that would bear out this conjecture. Of course as soon as the live fish is grasped he sets all his spines and holds them so stiff that they may be broken before they will yield to direct pressure, though they yield readily enough if the side just back of the pectoral fin be properly manipulated. The case of the grebe choked by the fish is described by Mr. Buckland as follows :-

scribed by Mr. Buckland as follows:—
By the kindness of Lord Radnor, Longford Castle, Salisbury, I have received a grebe (Podiceps minor) choked by a fish. The fish is fixed so firmly in the bird's mouth that I find it will go neither backwards nor forwards, so I can neither press it down the tesophagus nor pull it out altogether. The fish in question is a miller's thumb, Mr. Grebe evidently was not aware that the miller's thumb was armed with two very sharp spikes on each side of the gill cover, and when the fish found himself in trouble he simply expanded these spines, which fixed him so firmly in the bird's mouth that he died from suffocation. An exactly similar case occurred some few years since, which I described in the columns of Land and Water as follows:—

"Mr. Arthur Crichton has been good enough to pro

follows:—
"Mr. Arthur Crichton has been good enough to present me with an interesting spectmen of grebe (dabchick) which was found dead with a fish in its mouth. It was found by Mr. Clutterbuck, of Long Wittingham, near Abingdon, who writes as follows: 'The grebe was found in the River Isis, in an eddy, dead, both bird and fish. I saw a fellow grebe to-day, fishing in the overflow, which is more or less shallow. I do not know if the miller's thumb would leave the river for the overflow—most fish do. The river at the spot is deep. The bird was tound at the mouth of a ditch in which the water would be shallow, and dry when the river is low."
"The first thing I did was to make a cast of the specimen. Mr. Searle has painted it so life-like that it now looks like the bird liself. It is very difficult to cast a bird, but if the cast is successful, it is far better than any stuffing by the most shillful taxidernist. On dissecting the throat of the bird I discovered that the little spine-like processes on the sides of the head of the fish was headforemost, the back to the lower beak; the hard casing of the head of the fish had pressed so tightly down on the windpipe that it was completely closed up. Had the fish been swallowed the reverse way, probably the bird would have escaped unin jured. I have had two or three specimens sent me of kingtishers destroyed by fish stocking in their throats. There is a case on record where a poor fisherman was annoyed at finding the father-lasher among his sharings, and eszing him, put his head in his h scorphol, a sea-nsn anned to the tresmovater miner's thumb. The fisherman was amoyed at finding the father-lasher among his shrimps, and seizing him, put his head in his mouth, and attempted to bite it off. The fish, however, gave a struggle, slipped down his throat, and expanding his spines at the side of its head, managed to immovably fix itself in the larynx, thus killing the man by suffoca-

That Rat Catcher.—Boston, Ang. 7th.—Editor Forest and Stream:—I don't think that rat was drowned. The snake must have swallowed it then and there, or it would have gone home to digest his meal. It is most likely that he surprised the rat and sprang on it unaware, and once with its teeth fast on the rat's head, he would suffocate it in no time, without its having the gh st of a chance; besides, his prey was probably nearly paralyzed with fright. No matter how "game" it may be, there are but very few animals on two legs or four that are not pamic struck at the sight of a snake". As to not finding wounds, that is not singular. The snake's teeth are sharp as needles, but equally fine, and while arranged for the purpose of holding—a dozen rows or so across the root of his mouth, and all pointing backward—are useless for chewing purposes, and their very fineness would prevent their leaving marks. The rat could not have lived long enough to struggle much any way, for a snake is one of the strongest things that live, and with its nose pointing inward and its head half swallowed from the outset, it must have smothered speedily.

If the snake is what I have been accustomed to term

speedily.

If the snake is what I have been accustomed to term If the snake is what I have been accustomed to term "water snake," it could not have crushed him. Constriction is only used with effect by tree snakes, while the striped snake and his cousin, the present incumbent—if indeed they are not the same—are never found there: although I did once capture a monster in a very scrubby yellow boust, fifteen feet from the ground, but that was hardly a tree, as it was so thickset that be undulated from twig to twig, not coiled around.

In conclusion, I would say that I ought to know whereof I speak, having had, as a boy, a mania for snakes, having had, as a toy, a mania for snakes, having had, as a toy, a mania for snakes, attempt them by the tubful to watch their habits. At that time and afterward, I was accustomed to carry home every one I met to turn loose among my squash bugs. They are excellent buggers. But it takes a swift hand and a quick eye to get a grip in the back of their neck without a bite.

JOHN PRESTON TRUE.

We are rather inclined to doubt the constricting powers of the water snake, and for that reason suggested the drowning of the rat.

#### CARP APPRECIATED IN TEXAS.

HAT the carp are rapidly growing in favor in the Southern States is a well-known fact. The following letter shows what they think of them in Texas :-

ing letter shows what they think of them in Texas:—

Kosse, Linestone, County, Texas, June 28th,
Prof. Spencer F. Baird, United States Commissioner
Fish and Fisheries:—
Dear Sir: The German carp, sent Sam Bell and me last
fall, are doing as finely as any one could possibly ask.
When they arrived there was very little water in our
pond, so we put them in a well with about four feet of
water in it, and connected the well with the tank by
means of a small ditch, letting the tank water fill it up;
the ditch was left open so that the water would not stagnate. We put five of them in the tank (or pond) and fed
all of them on corn bread and vegetables that had seed,
such as tomatoes, squashes, etc., all of which they ate.
They seemed to like the squash best and preferred it
baked. Several of them seemed to be sick when they
reached us, and died soon afterward; the remainder are
now about four inches wide and a foot long. Corn bread
is their favortie det: and by feeding them at the same
place every day they become accustomed to look for it,
and now all we have to do when we wish to look at them
is to tie a piece of stale bread to a string and thoat it on
the water, when they come up all around it and scramble
for it as hogs do for corn. There are numerous parties
in this neighborhood with good pouls who want to know
whether they can get any this summer or fall. Please
let me know at once, as fish in this section are scarce and in this heighnorhood with glood points who what to know whether they can get any this summer or fall. Please let me know at once, as fish in this section are scarce and high, and the carp seems to be the fish. Yours truly, VOLNEY METCALFE.

#### SHAD IN THE COLUMBIA RIVER.

ASTORIA, Oregon, July 22d.

SHAD IN THE COLUMBIA RIVER.

ASTORIA. Oregon, July 22d,
Prof. Spencer F. Baird, Washington, D. C.:—
Dear Sir: Your letter of the 3d inst., asking for fuller information in regard to the presence of shad in the Columbia River, came duly to band; and, in reply, I will say that the first fish of this kind was taken early in the fishing season of last year (187b), in a stationary fish-trap in Baker's Bay. a few miles—one or two—above Fort Canby, W. T. I did not see this fish, but it was shown by the owner of the trap. Ospt. James. Williams. Tanzy Point cannery, Oregon, to George Hune, a well-known salmon canner of the Columbia, who pronounced it a shad. A few days later Capt. Williams brought two more to Astoria and gave them to Hon. D. C. Ireland, editor of the Daily Astorian, who invited me into his office to see them. I had never seen a shad, but thought they agreed sufficiently with the best description I was able to obtain. I took their measure and made the best description found, and sent it to Col. Webber. Commissioner for New Hampshire, who wrote back that they certainly were not shad: basing his opinion upon the fact that they had six or eight small, round, dark spots along the lateral line, and a projection of the scales along the belly which I described as a "sickle edge." Col. Webber sent my letter to you, and you expressed the opinion that the fish in question was some unknown species of herring, and asked me to save and forward a specimen. Shortly after taking the two last mentioned, the traps were swept away, and no more were taken that year. If had been cut in catching, and was otherwise in poor condition, but he told me that his trap had been in jured and he might not get another. I sealed the specimen in a tin case and was on the point of sending it to you when Prof. Jordan arrived here on his first taken. Except that it was larger—fourteen inches to eleven—it was exactly like those taken last year. It had been cut in catching, and was otherwise in poor condition, but he told me that his trap had

mention.

Whether shad will become acclimated so far as Whether shad will become acclimated so far as to propagate here is, I think, extremely doubtful. I am informed that in June, when they spawn, it is necessary that the water should have a minimum temperature of 70°. I did not test the river water at that time, but the mountain streams were as follows: Young's River, June 6th, 53°; Klaskani, June 27th. 58°; while the Columbia, to-day, in the ships' channel, is 65°. I think the attempt now being made to introduce carp into lakes on Clatsop Plains will fail for the same reason. In Eastern and Southern Oregon they may succeed. reason. succeed.

In closing I will say that I would like to know what food fishes other than the salmonidæ will thrive in a country where the temperature of the water is as above. I suppose it is well known that our winters are mild.

Respectfully yours, C. J. Shitti. I suppose it is well known Respectfully yours,

AMERICA'S EXHIBIT AT BERLIN,-The following letter shows how our exhibit appeared to the representative from France, who went there to study the fishery display

0

of all nations:—

Societe D'Acclimatation, Paris, July 22d.

Dear Sir: In the time of my last letter, I was unwell, and I had not the leisure to tell you all that I wished. Permit me to write to you now to express to you all my admiration for the magnificent show of the United States Fish Commission at the Fisheret Exhibition, in Berlin. The American division was utterly the first among all other sections in this exhibition, and it was in perfect correlation with the magnitude of all things made by the great American people.

There was much instruction to gather for us in this display, and it was a great pleasure for me to see all those things, in company with the learned Prof. Brown Goode, and Mr. Mather. The apparatus of the "Fish Hawk," above all, amazed me. How much we have to do, in France, to follow your countrymen in the work of fish culture!

reanes, to follow your countrymen in the work of fish culture!

I must acknowledge that in our country very few people understand, as it deserves, all the importance of fish culture. The Societe D'Acclimatation is nearly alone in the work, and as its resources are very small, the results every year are not extensive. However, we hope this year to create a laboratory with a little school of fish culture, in which we shall exhibit as far as possible all the apparatus and methods used in foreign countries, particularly the recent American improvements, and also living specimens of all species of exotic fishes worthy of special attention. I do not fail to make you acquainted with the execution of this scheme, and I trust you will be good enough on occasion to grant us the aid of your precious advice.

I have the honor to be, dear sir, yours most respect-

of your precious advice.

I have the honor to be, dear sir, yours most respect fully.

RAYERET WATTEL, Secretary, Monsieur le Prof. Spencer F. Baird.

#### MOVEMENTS OF SALMON.

N our issue of July 22d we published a letter from Prof. Hind to Prof. Baird, entitled "Late Appearance of Canada Salmon," which contained a new idea on the use of the hook on the lower jaw of the adult male during the breeding season. This letter attracted much attention, and was widely copied. We print below Mr. Mowat's letter on the subject to the Mirimichi Advance, in which he does not agree with Prof. Hind in all things, although he indorses his views upon the use of the hook, which the Professor says is for the purpose of rupturing the ovarian sac and allowing the eggs to flow into the ducts, an operation accomplished, as he says, by the male fish griping the female behind the pectoral fins. Mr. Mowat

an operation accomplished, as he says, by the male fish griping the female belind the pectoral fins. Mr. Mowat says:—

Prof. Hind's letter on the unusual scarcity of salmon in all our North Atlantic rivers this year possesses very great interest, and I hope it may be the means of further clucidating the mystery. "The oldest fishermen," of whom we have a few good specimens, say—and it is some comfort—that forty years ago, when salmon were in abundance, they experienced just as poor, if not worse years than this has been. Many men of skill and knowledge believe that from the marks, bruises and worn condition of very many of this season; sish they have actually been caught in the grip of the ize, or embayed by it and destroyed in some way in their migration here. Our weather here last fall was not colder than usual, and the river presented a good show of both salmon and pribse, as well as a very large show of smolt and parr. All the June and July fish, also, had gone before cold weather. The Professor says some salmon only visit the rivers for sanitary purps cse, being biennial spawners, or only doing so once in two years. Before I can believe this theory I must have stronger proofs, for such salmon do not enter any of the Bay Chaleur rivers. All our June fish (and they seldom arrive before the 1st—often as late as the 10th) have the ova half developed. The July and August fish are still further advanced, giving ova about Oct. 10th, finishing 20th, and going to sea in about ten days after, some of them immediately. During the seven years I have been engaged in pisciculture the time has been uniform, not varying more than two days, even although the salmon chanced to come three weeks earlier. These fish do not winter here in the river, and whether they are the first fish of the aucceeding spring I coannt say, but I suppose they are. Our spring kelts are fish coning from sea late (or in middle) of November with the ova at the same stage as the June fish, and I should think requiring three months to mature; they go w

not long ago, a salmon at the Indian House, with a partially digested caplin in it. The caplin never leaves salt water, and the nearest point at which the salmon could get it is Huron Island, seventy-two miles from Indian House. That extreme cold may retard the growth of the ova, is possible, but to extinguish the intinct or desire to spawn after the ova is fully developed is impossible.

Owing to the very heavy and severe ice runs, both fall and spring, as well as the heavy spring freshets, which most of our Canadian salmon rivers are subject to just at the time when ova is newly laid, or when the young fish is bursting the shell, artificial propagation is much more a necessity than in more favored countries. This last spring particularly the river bed has been completely upset by spring ice destroying most, if not the whole of the naturally laid ova. Independent of this cause, I know, from actual examination, that three-fourths of the ova naturally laid are dead eggs. I attribute this fact principally to the rapidity of the water carrying away the milt before coming in contact with the egg; probably, aiso, to either a want or an excess of males. I have observed on a bar where fifteen or twenty fish were spawning a large male rushing round chasing smaller males and cribes and baying little attention to

tribute this fact principally to the rapidity of the water carrying away the milt before coming in contact with the egg; probably, also, to either a want or an excess of males. I have observed on a bar where fifteen or twenty fish were spawning a large male rushing round classing smaller males and grise and paying little attention to the females spawning, and we now know that if the egg is a very short time in the water without contact with the milt it will not fructify.

I do not ignore the giving of all due care to the prescrution of the river, so that a good stock may be always there for natural production, but when by artificial production 18 per cent. can be turned out, in our Candian rivers at any rate, it is a most valuable assistance and one that we cannot afford to despise.

That every river has its own fish is certain, and that every fish finds its own river, and knows it—and knows the portion of it where it passed its young days—I believe also. I saw a peculiarly marked fish, having three old spear wounds on one side, while boating in the fall of 1807. She was spawning on the bar at Larry's Gulch. The next fall, not five yards from the same place, myself and men again saw her. In the June of the following year, I found her in Mr. Haddow's ice house at Athol House, taken in a net there. Her weight was thirty-three pounds. The three sears or cicatrices on one side were so marked llat there was no possibility of mistaking the fish.

Salmon in some rivers may rush, and keep rushing for the headwaters as, for instance, in the Frazer River. I give our salmon credit for more sense; they know there is more danger in the small, contracted pools, or leadwaters, than where the big pools and deep water exist, and since the thorough protection was inaugurated the large pool at Metapedia holds more fish than thirty miles of the Kedgwick, and fish now spawn from tidewater to the source. I am certain there are some of the very first un of fish in the Metapedia pool to-day, and any expert can tell by the color and co

### FLY-FISHING FOR SHAD.

Springfield, Mass., July 24th.

Entropped, Mass., July 24th. Editor Forest and Stream:—

Intimated that I should soon revisit Holyoke, and essay the capture of some of the gany beauties in a scientific manner, by casting, instead of the usual style practiced there of fishing with a long line—that is, if I could find my incomparable tip. Well, I found that tip—now don't smile—for it was in the hollow cane all the time, stuck fast. Let us change the subject, for I know that in your crowded columns space is valuable, and therefore I will not occupy it with the comments that I offered upon the occasion, but will at once take you

On the breast of the beautiful river, Where glotions sport can be had; And set your quiet nerves all a-quiver, in a light with the gamy shad,

And set your pure nerves all a-nuiver. In a light with the gamy shad.

The Professor accompanied me upon this occasion—not that he cared to fish, but his scientific 'sensibilities had been greatly shocked by my assertion of the fact that shad not only regularly feed in fresh water, but afford first-class sport. This statement was so much at variance with his preconceived notions that he repudiated the idea at once, and laughed me to scorn for setting myself—a mere tyro—against all of our well known ichthyologists in a matter of fact; but as I stoutly maintained that I was right, he consented to go with me, stating that he could disprove my assertions, or at least explain their inconsistency. When we arrived, we found that my favorite position was occupied, and so cast anchor just below the old pier, where the two currents meet. As the Professor was a stranger to "the delights of the swaying rod," he trusted his fortunes to a hand line, and I commenced whipping across the current. It was half an hour before either of us got a rise, when the Professor, who is a little inclined to be nervous, gave a fearful yank, and with many ejaculations and much struggling with the line, hauled in a clam as large as my hand. Instanctively realizing my opportunity to repay him in kind for some of his many lectures upon his favorite topic, I assumed a look that Solomon would have envied, and in a candid tone of voice that almost persuaded even me that I was enuncating fundamental truths, I turned my honest eyes full upon his face, saying: "Professor, I am utterly dumbfounded that you should express surprise at so

common an occurrence. Why, every schoolloy knows that the festivo clam will, in his gayer moments, sportively rise to the fly; and to see a naturalist of your well-earned reputation ignorant of the fact fills me with astonishment, and I no longer wonder that you dispute the equally well-known fact that shad will also rise." With a comical grinnace he expressed himself as now willing to believe anything, and that he was ready to swear that, not only would shad bite, but that I could pail them in with that whipstick. Just then I saw the swirl of a heavy fish about thirty feet away, and quicker than thought my stricken fly was lightly dancing among the undulating circles—there was a slivery flash and a sudden shower of pearly drops thrown high in the air as my victin seized the line; and, as with "instinctive turn of wrist." I fastened the cruel steel in his mouth, he gave a leap that showed his magnificent proportions and with speed of a frightened bird rushed down the stream. I was entirely occupied with my fish, but I must have glanced at the Professor, for I can yet see the look of wonder—almost awe—in his wide open eyes. No word was spoken, for my heart was too full of satisfied pleasure. No doubts or fears disturbed my mind, for my trusty tip was in place and bending all its energies to accomplish the defeat of our scaly foe. After more than half an hour of most exciting sport, I slipped the landing net under him, and with a long-drawn satisfied spl., lifted him into the boat. We could not tell his weight, as my pocket scales register but six pounds, and they proved inadequate to the task. We at once resumed our fishing, and the Professor had extraordinary luck in getting bites; but not a fish did he land. In vain I cautioned him against twitching their heads off. No sooner did he feet the "soul inspiring thrill" than with a spasmodic yank he would tear the book from their tender mouths, and then wonder "why they didn't bang on." I soon had another one going, and as he kept near the book from their tender mo

it—"he can swallow anything."

"Yes," said he, "and I should not be surprised if you were to tell me that they went ashore nights and robbed hen-roots."

Whether this was intended for a sly kick at my homily upon the clam, or merely the fanciful expression of his highly wrought feelings, I am unable to say. Our squadron was now reinforced by a cockle-shell of a boat containing a crew of two men who brought their frail craft to anchor about thirty yards to our right, and a little below us, thus giving us a capital view of the performance that I shall attempt to describe, although mere words will convey but a faint idea of the scene.

After safely mooring their tottlish boat, they let out a line from each side and one from the stern; then the man who was stationed aft put his rod together, and tying a couple of flies to the end of his line with a good square knot, he took off his coat, and, spitting on his hands, raised up on tipoe and—well he didn't throw his rod clear ashore, as I imagined he was going to, but with a powerful back-handed swing and a sudden jerk forward that would have snapped a green hickory, he landed his flies upon the water with a splash that was only equalled by the noise of the rod as it followed suit and buried half its length beneath the surface. Just here the Professor attempted a witticism at my expense, by saying that the man was casting. You will readily perceive the animus of this upon Jearning that the only casting fliat he had ever seen was at my hands; but entirely ignored the feelbe effort, and confined my attention to affairs in the little boat, which swayed and rocked fearfully at each successive throe of the stalward fisherman, who kept it up bravely, and literally lashed the waters into foam. Not the least amusing part of the performance was to see his companion dodge at every east. After watching him awhile I came to the stalward fisherman, who kept it up bravely, and literally lashed the waters into foam. Not the least amusing part of the performance was to see his compani

I had intended to descant upon the thrilling sensations experienced at the strike of a lively fish—although your companion may be playing him at the time—but this will keep until my next.

Bass Robs and Bass Nomenclature.—Leesburg, Va., July 30th.—The Potomac and Goose Creek have been deplorably "unclear" for more than ten days, and even their tributaries near this place have been unfit to fish. I have, as a substitute for sport actual, especially Dr. Henshall's excellent papers on black bass and hyfishing for them. I have some notions on the subject, possibly heterodox, which I wish to air. For instance, on the position of one's rect. I find it most convenient to cast with my real underneath; but to play my (?) fish with the reel on top, where I may see the him as it goes ont, and regulate the "go" thereof. As soon as I hook a heavy fish, I lay my rod in my left hand, the reel up, handle to my right, and right hand itself holding the butt, or working the handle of my real as the occasion seemeth to demand. The only trouble I have, is from the twisting or warping of the rod. If, however, I play the fish with rings underneath (as I cast), the rings are more quickly worn so as to fray the line. One can take a m'dole course, though cast and play your fish with reel and rings underneath, except when the fish runs toward you, and then transfer to the left hand, using the right in reling in the line.

With regard to flies, I fancy those tied on about a No. 35proat, or round bend of like size, with the wings reversed and separate. I know that trout flies when in the water have usually their wings stuck together, being wet. Yet the separate-wing flies seem more attractive, and I believe areas to the fish. Now comes what I fear is a heresy in rods. I like a three-piece rod with the butt piece longer than the mid-piece and the mid-piece donger than the mid-piece and the mid-piece donger than the held up for the equal division of the whole length. Two pieces of equal size and length, as equally strained as possible, with line through rings, would be practically university to the root of greatest strain would be at the joint and nearer the heavier and of how heavier piece, i.e., towards the butt, and if the

The name Micropterus (small-fin) is not so very inappropriate if the pectorals are considered, besides it is really not important that a name should be descriptive in these days when new discoveries render the descriptions useless. (See names like fluviatilis, vulgaris, etc.)

Concerning the mouth question, the size is only relative, and the mode of measurement is with the mouth shut, and to note how far back it is cleft. This is one of the principal marks by which the two species are separated. In the "big-mouth" (M. pallidus) it extends to or beyond a vertical line dropped from the posterior part of the orbit, or cavity of the eye, while in the "small-mouth" it only extends to about the middle of the pupil.

BLACK BASS AND ROCK BASS.—Millwood, N. C.—What you call at the North the rock bass, we call here the black perch. They grow to a pound weight, and are a fine table-fish with us. I live within three miles of the Virginia line, and was raised on Dan River, the dividing line at this point between North Carolina and Virginia. I have caught many fine perch out of the Dan River, and also the red have the latter resembles a mullet or sucker, and the latter that the sucker is remarked to the control of the Dan River, and The words of the Dan River, and also the red horse. The latter resembles a mullet or sucker, but they are a fine fish, weighing sometimes us pounds. The "goggle-eye" is the largest perch we catch. The "red-eye" is smaller, not as large as the black perch, and is of a different color. I may be mistaken as to the "red-eye", as I have not caught one for many years, and have no distinct recollection of them, as I was then a boy. If think they are what you call black bass; are lighter incolor than the "goggle-eye," but are very red eye. The black perch are lark in color, hence their name. I have caught fifteen very fine "goggle-eyes" in a short time with hook and line. I have seen silver perch caught with hook and line in the pond here weighing something over a pound. It was the pretitest fish I ever saw. It shone as bright as the brightest silver dollar when landed. They are baited with minnow, same as the "goggle-eye," but are not as good a table-fish as the latter, nor the black perch. The latter was formerly caught in the pond in grant of a good a table-fish as the latter, nor the black perch. The latter was formerly caught in the pond in grant of a good a table-fish as the latter, nor the black perch. The latter was formerly caught in the pond in grant of a good a table-fish as the latter, nor the black perch. The latter was formerly caught in the pond in grant of a good a table-fish as the latter, nor the black perch. The latter was formerly caught in the pond in grant of a good a table-fish as the latter, nor the black perch. The latter was formerly caught in the pond in grant of a good a table-fish as the latter, nor the black perch. The latter was formerly caught in the pond in grant of a good a table-fish as the latter, nor the black perch. The latter was formerly caught in the pond in grant of a good a table-fish as the latter, nor the black perch. The latter was formerly caught to be pond in grant as good a table-fish as the latter, nor the black perch. The latter was formerly caught to be caught with mi

stream for fish, rock bottom, and abounds in springs. I blink the pond is quite deep. Don't you think the salmon trout would do well in it? also the carp? If you think the salmon trout will do, I would like to try them also. Do you think my pond is too large for salmon trout, and are they much trouble to raise? They have been catching the red horse out of the Dan now for two or three weeks. They are caught in "dip-nets," laited with mush, made out of corn meal with cotton worked in to make it tough. They are also caught with "grab-hooks" baited with mush. The "grab-hooks" are an overly to some of you that never saw them. They are put on lines with one small hook for bait, and thelw it three large hooks tied on the line in a circle; these are called grabs. When the fish sucks (they seldom ever swallow a bait) the mush on the small hooks, the line is jerked upward and the fish caught under the throat by the grabs. The red horse, as I've just said, are rarely ever caught by swallowing a bait, hence the invention of the grabs, which chins the fish, when they suck the dough on the bait hook. I give you these little items, thinking they may interest you. I'm a proficient at chinning. I have clinned many a pike, when the water was too clear for them to bute, and when they are very shy and wary and will not allow you scarcely to approach the bank where they sun themselves without darting off into deep water out of sight. It will not be long before they are catching the perch in the Dan. I will study their species, color, etc., and write you. R. S. B.

We have supposed the names rock bass, "goggle-eye"

We have supposed the names rock bass, "goggle-eye" and "red-eye" to belong to one fish, the Ambloplites rupestris, but the common names of fishes are fearfully mixed. We incline to the opinion that your "black perch" is the black bass of the North. The name bass is used at the North for most of the fishes which are called perch at the South. If the water in your pond rises above 70% at any time, it is not suitable for trout : better try the carp. The salmon trout, or lake trout, do not thrive in small lakes or ponds. Unless your "pond" is over a square mile in extent, and from thirty to sixty feet deep, with a bottom temperature in summer of 60°, or lower, you can do nothing with lake trout.

Texas Trout.—Corpus Christi, Texas.—In your issue of June 10th, I see an article by Dr. J. A. Henshall, of Cynthiana, Ky, another by C. L. J. of Willis, Texas, and a short note from Hastings, of Austin, Texas, concerning Texas "black bass," or "trout."
There may be genuine trout in Texas, but if so they are very far from the limits of civilization, for I have fished Texas waters since 1818 and never saw a speckled trout other than what is called in the South "salt water trout," and in the North "weakfish."
As to the black bass, I have caught what are called black bass in the Western States, in nearly every stream in Western Texas, for aside from the "croppie" or "govgele eye." the "wide-mouthed perch," and the "rect-bellied percel," or "sunfish," they are the only game fish of any note in the fresh waters of this State, south or west of Austin.

in Western Texas, for aside from the "croppie" or "going eye" the "wide-monthed perch," and the "rod-bellied perch" or "sunfish," they are the only game fish of any note in the Iresh waters of this State, south or west of Austin.

All of these fish are taken from the same streams and at all seasons of the year, as they do not hibernate this far South. The croppie is at times a voracious biter, but is weak and shdes out of the water as easily as a piece of tin. He is generally about as flat as a shingle, and affords but hitle sport to the augler. At other times, although they may be seen plentifully, they will not touch bait. Thave given to him an alias, viz., "goggle eye," on the authority of persous better posted in fish nomenclature of the North and West than myself, although I confess I do not like it, as I always considered the "croppie" and the "goggle eye" as two distinct fish. The Doctor (Henshall) gives the "rock bass" as the "goggle eye," and says he is not found in Texas.

Hallock's "Sportsman's Gazetter" gives "rock bass," "croppie" and "goggle eye" as identical. I do not know which is right, but I do feel satisfied that we have any quantity of black bass proper in Texas, and they grow large, too, as I have taken more than one over five pounds in weight, and I saw and purchased one over nine pounds. This fish is identical with the one known as black bass in the Western States, and, as C. L. J. says, it differs according to the difference of the waters in which it is found, etc. One taken from a clear spring stream, and another from a muddy lake placed side by side, would not even be called relations by marriage, so little would they resemble each other.

Now, what is the fish I have alluded to as the "widemouthed perch?" If is is as deep as a sunfish of the same length, about twice as thick and has a mouth like a black bass. His color is that of a bass, and he is as game a fish in every way, and as fine eating. I have taken them in the Perdinales, sevenity-hive miles west of Austin, weighing upward o

the nowers that he to draw from these lakes to an unthe powers that be to draw from these lates to an un-usual extent, in order to supply the needs of the fac-tories at Lewiston. The water throughout the whole chain of lakes is lower than for several years. The re-pairs in progress at the Middle Dam also necessitate the drawing off of the water, and the whereabouts of the trout is a problem at present unsolved. Very warm weather and low water have probably combined to cause weather and low water have probably combined to cause the fish to seek the deepest part of their feeding grounds. But as the number of fishermen is greater than heretofore, the haunts of the big trout will soon be discovered, and due report will be made to your readers. Wild rice from Rice Lake, in Canada, was sown in May, after being well soaked, but has not shown itself as yet. It was sown according to directions, in from four to six feet of water. Some, claiming to be well informed, say it does not sprout the first year. Can any reader of experience give information as to this? The new route rid narrow gauge railroad to Phillips' is very popular, and Page's. Elmwood Hotel at Phillips' is a resting planded to all who are en route to the lakes. The hotel is extremely nice in all its appointments, and deserves the large patronage it has received. The lake road from Andover has been considerably improved since last year. More anon.

Forked River.—"Riverside House," N.J., Ing. 15th,
—Fishing is capital here yet, the catch of weakfish ranging from 25 to 150 per boat per day, with three or four bluefish, as they are again beginning to bite. One man caught five large ones yesterday with a squid, by throwing into the surf from the shore. Striped bass are beginning to bite, and a few have been brought in for the last two days, and we anticipate bass fishing in carnest next week. Mr. Lawrence brought in the finest string of weakfish of the season, all over three pounds, and one of them weighed three and a half when dressed; so you see the rod has not been laid by, although the breech-landers are hard at work. Our score to-day was; The Magie, Mosres, Spears, Morrell and Faweett, twenty-one weakfish; the Idle Hours, Mr. C. E. Corbin, sixty weakfish; the Belle, twenty-nine large ones.

LAND-LOCKED SALMON IN RANGELEY LAKES,—Cournelland.

LAND-LOCKED SALMON IN RANGELEY LAKES,—Comp. Kewbayo. Aug. 2d.—I have known of fine land-locked salmon being taken in our lakes this season; the largest was taken about two weeks ago at the mouth of the river (near Upper Dam) by Mr. W. E. Sheldon, of Putnam, Conn. Weight, four pounds.

Large Fishes.-Last week Mr. Blackford had a fifteen LARGE FISHES.—Last week Mr. Blackford had a fifteen pound sheepshead (Archosargus probatocephalus) upon his stand in Fulton Market which was one of a lot of fifty which weighed from ten to thirteen pounds, caught near Barnegat, N. J. This is a very unusual size. This week he had a Spanish mackerel (Ophum maculatum), of serven pounds, which was caught off Orient, Long 1stand

land.

RED SNAPPER IN RHODE ISLAND WATERS.—A fine
"red snapper" (Lutjanus blackfordit), was captured in a
pound net on Rhode Island, on Tuesday, Aug. 19th, and
sent to Fulton Market. This is the first recorded occurrence of this sub-tropical fish so far North.

rence of this sub-tropical fish so far North.

MACKEREL.—Mackerel are exceedingly plenty all along the coast of Maine, as far ext as Ponobsoot Bay, fishermen say the most abundant they ever knew, but they are mostly small. Menhaden scarce, but still some. Off Harpswell the hake has been exceedingly abundant very close to the shore. The fishermen say the dogfish have driven in the bait (small fish), and the hake have followed.

sundpiper, suipe, curlew, oyster-catcher, surf bird, phalaropes, awareds, etc., coming under the group Limneole, or shore lards, Many States permit prairie towl (pinnated grouse) shooting after

-Our Office Boy has just returned from Bill Laue's resort at Good Ground, L. I., with a fine bag of bay birds. He says Mrs. Lane's wholesome table was well supplied, as usual, and the kindness he received will not soon be forgotten. The flight of birds was unusually good, and he wants to go again next week.

draw the charges, but took it all loaded from its corner in the shop, and started with the rest. They reached the shore in safety that night, and next morning before light, took their stations along the ridge of the beach, concealed in the tall grass and bushes, and awaited the flight that generally crosses this part of the beach about sunrise. A little after daylight a tremendous honking was heard, followed by an immense flock of geese heading straight for Alvin. As soon as they got almost overhead, the boys saw Alvin rise from the bushes and point the old gun at the flock. Holding their breath they waited the result. There was no explosion. The gun was lowered, and then again pointed toward the geese, and still no smoke issued from the hitherto reliable old piece. The boys shouted "Shoot, Alvin, shoot," but no answer, and as Alvin shouldered the gun, and came toward them, they came rushing up to see what could be the trouble. The first words of the old man were: "Boys, you seen anyting of that Ben Gray around my shop lately?" The trouble was soon found, for upon lifting the bammers a small shoet-tack was found to have been driven into each tube, and the cap replaced over the tack. (Ius says he never shalf forget the look on Alvin's countenance when he saw the tacks.

never shall forget the look on Alvin's countenance when he saw the tacks.

Ben kept out of sight for a few days, and it was finally forgotton, but for a long time it was hardly safe to mention shoe-tacks in connection with geese.

Alvin has passed away, and the breech-loader has taken the place of the old fashioned gun. But occasionally in Plymouth woods you will run across one of these old weather-beaten chaps, who clings to the old muzzle-loader, and will stand all day on a cartway if 'he stands any show for a shot at a fox.

RAMROD.

A CAMP MEETING INCIDENT.—Washington, D. C., Aug. 61h.—A recent trip through Maryland and Delaware convinced your correspondent that there will be fine shooting the coming season, in the shore counties of the fromer State, and the southern part of the latter. Particularly is this true of Sussex County, Del. In Georgetown, I was informed by Mr. R. A. Rosenbourn, a thorough sportsman and a gentleman, that quail will be abundant. I saw myself several specimens of Messina birds, planted these some years since, and they seem to take kindly to our soil and climate, and it takes a quick eve and steady hand to stop them when once on the wing. Spairrels also are plentiful.

Steaming down the Choptank River and contemplating the queer motions of the sea nettles in the water from the hurricane deck, my attention was attracted to a group of ladies and gentlemen sitting near. A clergyman, on his way home to Baltimore from camp meeting, was detailing to them some incidents of camp life. Among A CAMP MEETING INCIDENT,-Washington, D. C., Aug

his way home to Baltimore from camp meeting, was detailing to them some incidents of camp life. Among others was one of an old couple who had supplied them selves with a bottle of pennyroyal oil with which to keep off the mosquitos. They extinguished their light and cetired, forgetting the antidote. The mosquitos were very bad, and after standing it as long as they could, the old lady got up and got a well-filled ink bottle instead of the oil, and gave the old gentleman a thorough lubricating with the liquid, face bands and feet; she then anointed independent of the process of the polar part of the pa

nearly as hig as a bale of hay, and she caring for him with the greatest solicitude.

How Daniel Webster Thought it was a Squirrell.

—Editor Forest and Stream:—Your recent comments on the carelessness of those who call themselves sportsmen, often resulting in the shooting of their companions, reminds me of an incident in the early life of Daniel Webster, who was fond of hunting and fishing. It is recorded in the 'History of Boscawen, N.H.,' where he first put out his ''shingle' as a young lawyer, that 'he knew every brook and pond, the best places for trout, and the choicest spots among the filly-pads for pickerel.' and scoured all the forests of the region for game in its senson. One of his companions on his shooting excursions was Nehemiah Clark. While they were gunning one day, a grav squirrel secreted itself in the thick foliage of a tree, and Clark climbed the tree to disoldge it. "I see him," said Webster, raising his gun to fire. "Don't shoot me," seaf Clark, "No, I won't," said Webster, as he blazed away, and lodged the contents of his gran in Clark's leg, having mistaken the motion of the skirts of his gray coat in the foliage for the squirrel.

The writer has the motion of the skirts of his gray coat in the foliage for the squirrel.

The writer has end of the squirrel.

The writer has companion of his early sports, and always called to see him in his summer visits to the seenes of his youth. It was also current in the village that Clark, who was very poor, received frequent substantial tokens from Webster, who was a lavish in his liberality as he was tenacious of early frendships. A.

Fish and Deer in Minnesota.—Burnhanatille, Todd Constit. Minnesota.

crality as he was tenacious of early friendships. A.

FISH AND DEER IN MINNESOTA.—Burnhamaville, Todd
County, Minn., July 22d.—I am far from being envious
of my brother sportsmen who, from time to time, have
reported their exploits in your columns; in fact, the
more of their reports I read, the more thoroughly I am
convinced that "my lines have fallen unto me in pleasant places, and that I have a goodly heritage."

Last Saturday afternoon I went to the outlet of Little
Swan Lake, ten rods from my house, and in ten minutes
had landed four black bass, averaging four pounds each.

I then went to the house for my wife, wishing her to
share in the sport.—I think it abominably mean that
sportsmen do not oftener give their wives a chance—
and in fifteen minutes she had landed seven more bass
fully as large as mine. We were using the good old orthodox bait—fregs.

fully as large as mine. We were using the good old orthodox bait—frogs.

A few days ago, having occasion to cross a small lake,
I took my trolling line along, and in crossing captured
six large bass and nine wall-cyced pike.

I have killed pickerel here weighing fifteen pounds,
and but spring a lady near by took one with a spear
which turned the scale at twenty-one and a half pounds.
As for duck shooting, I can, in the fall, bag from fifty
to one hundred in a day, and not work hard.

I presume there were two hundred deer killed in this mmediate vicinity last hunting season, and the fact that found eight in one little slough last week, and coming some saw four more, proves that there is still venison as the that

to be had.

This town is one hundred miles from Minneapolis, and twenty from Little Falls our nearest railroad point. Good board can be had for from §4 to §6 per week, and if any true manly sportsmen wish to come in, I can assure them a cordial welcome, and will send my team to Little Falls to neet them, if given sufficient notice.

In closing, allow me, for the benefit of others, to give my hearty indorsement to the Osgood folding canvas boat. I have been using one this summer, and 'tis "just splendid,"

"just splendid."

GAME AND DOGS IN QUEBEC.—County of Nicolet, P. Q., Aug. 7th.—Black bears are reported as very numerous this summer in the townships of Wendover and Aston. Two dogs started a big follow close to a habitan's house, and one of them venturing too close was killed and partly caten afterwards. A man employed in the woods ran upon a bear unexpectedly, and was seized by the bear with his paws, but the man's friends running up he was released by the bear, who escaped. The poor fellow was considerably scared, but received no injury. Ruffed grouse, or partridges, as they are here called, are very plentiful, and I hope to bag a few this fall, Hardly any pigeons have been seen this year, and other shooting we have none.
Dogs in this part of the country are of all sorts of shapes and colors, and the greater variety of colors a dog has the better the French Canadian farmers like him.

has the better the French Canadian farmers like him. The dogs of really any breed in particular could be counted on the fingers of one hand. We have big black dogs, with curly tails, little black dogs, gray dogs, red dogs, lots of yellow dogs, and one to my certain knowledge of a dirty blue. They all have lots of bark and very little courage. I own several bulldogs, procured for the especial purpose of taking the curl out of the tails of the above-mentioned more rels. I have succeeded in my design, and all dogs giv. . y premises a wide berth. HEMLOCK.

BUNCHED SHOTS.—Montreal, P. Q., Ang. 9th.—Therewith inclose a sample of several targets which I made the other day. This was done at thirty yards, the paper being pinned to a pine tree. The cartridge case was loaded with three and one half drachms C, and H, powder, two wads, one pink edge and one card-boatd, one and an with three and one half drachms C, and H, powder, two wads, one pink edge and one card-board, one and an eighth ounces of shot, No. 7 chilled. Another instance occured to me, while giving an exhibition of fancy shots at the Theater Royal, two of the shells having bunched their shots into the form of a bullet, and gone clear through tho back stage door. Still another instance with a 16 bore. By the way, in the two first cases above mentioned, the shooting was done with two different guns, both 12 bore, and the last with a 16 bore. The cartridges in each case were made according to your directions. I am at a loss to account for this. I should be glad to hear from some of your correspondents on this subject. The shot, as shown by the target sent to us, were

with the exception of a few scattered pellets, bunched together into a mass which left a hole in the paper small enough to be covered by a silver dollar. Such a charge would make bad work of a bird,

charge would make bad work of a bird.

NEW JERSEY—Riverside House, Forked River, Aug. 15th.—The snipe have come, and a good many of them have stayed—at least I can answer for those I have eaten. We have some steady shots here, and the daily bag of a single gun for the last week has ranged from fifteen to thirty-five large birds. A blue heron was shot by Prof. A. M. Mayer, and killed at fifty-five yards with No. 9-shot. The birds are very fat, often bursting open in their fall. Amongst the gunners are Dr. Mayer and D. W. Lee, of the "Century Club," South Orange; Mr. Peck, New York Evening Express; Mr. H. N. Lawrence, of the well-known Wall street firm of Lawrence & Smith, besides Mr. Frawcelt and Mr. Spears, from the "Swanpi" in your city, More recent arrivals include Messrs, Fox, C. J. Bulkley, J. Pillott, J. Morrell, all of your city, and Mr. C. E. Corbin, of Hart's Palls, N. Y. Boats are reasonable as ever, melons as thick in the garden as snipe in the bay, and with a generous table, a good cook, attentive servants and a host that makes you feel like a guest in the house of a friend, visitors to the Riverside House are as healthy and happy as they can ever expect to be.

MINNESOTA GAME PROSPECTS - Albert MINNESOTA GAME PROSPECTS.—Albert Lea, Minn., Aug. 8th.—The game prospects are better this year than for several years past, and chickens will be ripe next Sunday, and the music of the festive breech-loader will be again heard in the golden stubble. The wheat harvest will be tinished early in the week, which will leave a clear field for the dogs. There has been no rain for over a month, and it will be incumbent on the boys to carry jugs of water for the dogs, as well as flasks for themselves.

There has been no violations of the game law reported There has been no violations of the game law reported yet, although the Albert Loa Gun Club have posted §25 reward for conviction under the act. And speaking of gun clubs reminds me that the boys have been doing some pretty good work on eggs, especially state ones, which are cheaper than glass balls and a very good substitute. It is too early to say anything about the duck prospects yet, but we hope for a good crop of canvas backs and red heads.

A DAROTA ASSCIATION.—The sportsmen of Yankton, Dak., have organized themselves into the Dakota Game and Fish Protective Association, and have set themselves to the work of securing right game protective legislation, to enforce such laws, to secure the right of property in dogs, to protect at all times song and non-game birds, and to provide for the artificial propagation of food fishes. The officers of the association are:—Presidents, Capt. A. W. Lavender, of Yankton; Vice-Presidents, Commodore S. B. Coulson, Yankton; M. W. Sheafe, Elk Point; C. T. Campbell, Scotland; F. W. Gasmann, Springfield; D. M. Inman, Vermillion; W. H. Corson, Stoux Falls; H. H. Rudd, Lodi; C. F. Hackett, Parker; J. O. Walrath, Mitchell: A. F. Rudolph, Canton; George Miner, Milltown; J. D. Flick, Rockport; Secretary, E. West; Assis-

tant Secretary, M. S. Parker; Treasurer, H. A. Harvey. Our friends are none too early in giving this work their attention. We are much pleased to record the move-

RHODE ISLAND—Newport. Aug. 5th.—Shooting on the marsh is being done every morning. Some yellow legs and small sand snipe; some plover have been shot. Although the law is not off on woodcock until Sept. 1st, the birds are about all shot, and our local pot hunters have begun to invade Massachusetts, they find a market here amongst the same people for them.

OCCASIONAL

If Newport sportsmen care enough about the shooting, it would be a profitable investment to secure the enforce ment of the game law.

ment of the game law.

Vonkers Gun Clue.—This club was organized on Monday evening of last week. They adopted the Long Island Gun Club rules for shooting on the wing. The following are the ofticers: President, E. L. Thomas; Vice President, William Bates; Secretury, S. L. Farrington; Trensurer, P. H. Wing; Executive Committee, E. L. Thomas, A. M. Kolby, A. J. Kolb, George Langdon, On Saturday, Aug. 31st, they lawe their first practice a short distance from Yonkers. Pigeons and glass balls will be the targets. will be the targets.

WOODCOCK KILING NEAR NEWARK, N. J.—A Newark paper says: "The new woodcock law does not appear to be very effective thus far. No arrests or convictions have been leard of, while violations are constantly occurring and birds have been repeatedly offered for sale to restaurant keepers in Newark."

Where are the Newark game protectors, the members of the Essex Gun Club-where are they?

Ohio—Chilheothe, July 26th.—Quail will be quite plenty here this fall; have had a splendid season for them, and plenty of stubble. Some few woodcock and plenty of squirrels and rubbits. The close season of 1879 gave all the game a chance, and birds will be more abundant than for years before.

Indiana—Fairland, Aug. 6th,—Quail and woodcock promise fair shooting this fall, the latter not being disturbed hereabout during the summer. C. W. W.

#### SHOOTING MATCHES.

BATH, Me., Aug. 12th .- The third match of the series of 1880 by the members of the Sagadahoc Association was shot yesterday in Bowdoinham at 15 balls thrown into the air from a Card trap.

This was the last of the series and resulted in an aggregate of 38 balls out of 45 br John by Chus, L. York, of Brunswick, who received the first prize, the association balge for 1880. Alfred Williams and C. H. Greeniled were a tee on 37. In shoothnoof it bet the second prize was won by Alfred Williams, of bowdoinham, on second the A. Hall, C. Key and J. H. Miliay, were a tree on 35 balls, which gave C. Key, of Topsham, the third prize after shooting three ties. It will be remembered that an aggregate of 35 took the first prize last year.

took the first prize list year.

AUGUSTA, Mafire, July 23d.—Private match nt 100 bulls between Mr. P. O. Vickery and Messrs, E. W. Moore, E. G. Adams, P. E. Baker and E. L. Whitehouse, all being members of the Cushnoe Heights Gun Club, of this city. Vickery shooting 100 and the others 25 shots each. Card's rotary, 18 yards rise:

P. O. Vickery, 94: largest run, 35.

E. W. Moore. 22 10.

E. W. Moore. 22 18.

E. G. Adams. 21 7 B. L. Whitehouse, 20

J. E. B. BIROOKFFELD, Mass., May. 14th.—The Brookfield Sportsman's Club has now been in existence somewhat over a year, and has made a very good record for its age. It numbers 18 members. Messrs, Hobbs, Mathewson and Heredeen will average good I'b balls each out of the string of 20, Varney 16; Moulton, Shepard and Crosby 15 each, Gillu 14, Capen and Yunghan 13 each, Burterworth and Gerald 12 each, Richards 10, and Middagh 8. Twichtwo M. Wich. cerword and contain a case, access and cannot be rated as yet, but will doubtless run from 12 to 15, if not more. The club have got a very nice place for their shoots, it being on the Park ground, on the lake boach, the traps being placed out in the pond the regular distance, while the shooters stand on the shore pond one regum constance, which he showers sand in the safet. The high bluff, with a fine grove on its edge, affords a pleasant shade the whole aftermoon in the background, while all is clear as could be desired in front and on both sides for a mile away. The club contemplate making this the best glass ball shooting rue cun contempiate making this the best glass ball shooting ground in the country. Untrokeo balls fall lightly in the water, and are sure to float if not touched, but will sink if even one shot pierces it. The balls can all be safely collected; thus none are lost by being broken in any other than the regular way. The last regular shoot occurred Thesday, Aug. 1th, at 4 e.m., at which II participated. Mathewson took the palm with 19, white Gorald sunveised us with 15. Councils a consequent state.

E. SPARTANSBURG, S. C.—A grand glass bull and pigeon shooting tournament will be held at Spartansburg, S, C., commencing Thursday, Aug. 28th. Teams from Richmond, Raletgh, Fayette-ville, Charlotte, Asheville, Hendersonville, Sayannah, Augusta. ville, Charlotte, Asheville, Hendersonville, Savannah, Augusta, Atlanta, Charleston, Columbia, Orangeburg, Aiten, Newberry, Emoree, Winnsboro, Yorkville, Rock Hill, Union, Greenville, and other points have been invited, and are expected to attend.

### PUBLISHERS' DEPARTMENT.

AN UNUSUAL RECORD.-The life of Mr. H. H. Warner, of Rock seter, N. Y., was sayed by the Safe Kidney and Liver Cure, which now bears his name. What this wonderful remedy did for him it bus done for thousands, and, we believe, will continue to do for those afflicted with kidney, there or urinary troubles of any kind. If any reader has any organic trouble, this remedy will prove "a friend in need."

-For a handsome and comfortable lounging or invalid chair, there is nothing better than the "Wilson Patent Adjustable." See advertisement.

—Purchasers would do well to notice the reduction in price made by Wm. Read & Sons, of Boston.

WERE THEY FOR THE FOREST AND STREAM?—Three handsome panther skins were found in the mail-bags received by the steamship Arran, from Venezuela, last week. They were not addressed to any person, and Postmeter James sent them to the Custom-house. A dead bat, which had evidently been alive when mailed, and a twoly snapping-turtle, were also found in the domestic mail.

#### OF ENGLISH DOGGES.

The teconde Section of this

Of gentle Dogges seruing the hauke, and first of the Spanill, called in Latine Hispaniolus.

Veh Dogges as ferme for fouching, I thinke conuenient and requisite to place in this seconde Section of this treatise. These are also to bee reckoned and accounted in the number of the dogges which come of a gentle kind, and of those which serue for fowling.

The robe two and of those which serve for fowling.

There be two for fowling.

The first findeth game on the form of the water.

Such as delight on the land, play their partes, eyther by swiftnesse of foote, or by often questing, to search out and to spying the byrde for further hope of aduantage, or else by some secrete signe and priny token bewray the place where they fall.

The first kinde of the Hauke.

The secrete form the first first form of the first finde o

The net, or, traine, The seconde

The first kinde haue no peculiar names assigned vnto them, saue onely that they be denominated after the byrde which by naturall appointment he is allotted to take, for the which consideration.

Some be called \( \frac{1}{1}\) For the Falcon \( \frac{1}{1}\) and such like Dogges, \( \frac{1}{1}\) The Partridge \( \frac{1}{1}\)

The common sort of people call them by one generall word, namely Spaniells. As though these kinde of Dogges came originally and first of all out of Spaine, The most part of their skynnes are white, and if they be marcked with any spottes, they are commonly red, and somewhat great therewithall, the heares not growing in such thicknesse but that the mixture of them maye easely be perceased, Othersone of them be reddishe and blackishe, but of that sorte there be but a very few, There is also at this day among vs a newe kinde of dogge brought out of Fraunce (for we Englishe men are marnalious greedy gaping gluttons after noneties, and conetous cornorauntes of things that be seldom, rare, straunge, and hard to get.) And they bee speckled all ouer with white and black, which mingled colours incline to a marble blewe, which bewiffyeth their skinnes and afforderh a seemely show of comlynesse. These are called French dogges as is aboue declared already.

The Dogge called the Sotter, in La-

#### The Dogge called the Setter, in La tine Index.

The Dogge called the Setter, in Latine Index.

A Nother sort of Dogges be there, scruiceable for fowling, making no noise either with foote or with tounge, whiles they follow the game. These attend diligently vpon theyr Master and frame their conditions to such beckes, motions, and gestures, as it shall please him to exhibite and make, either going forward, drawing backeward, inclining to the right hand, or yealding toward the left, (In making mencion of fowles my meaning is of the Partridge and the Qualle) when he hath founde the byrde, he keepeth sure and fast shence, he stayeth his steppes and will proceede no further, and with a close, couert, watching eye, layeth his belly to the grounde and so creepeth forward like a worme. When he approacheth neere to the place where the birde is, he layes him downe, and with a marcke of his pawes, betrayeth the place of the byrdes last abode, whereby it is supposed that this kinde of dogge is called Index, Setter, being in deede a name most consonant and agreeable to his quality. The place being knowne by the meanes of the dogge, the fowler immediatly openeth and spreedeth his net, intending to take them, which being done the dogge, the fowler immediatly openeth and spreedeth his net, intending to take them, which being done the dogge, the fowler immediatly openeth and spreedeth his net, intending to take them, which being done the dogge at the accustomed becke or vauall signe of his Master ryseth vp by and by, and draweth neerer to the fowle that by his presence they might be the authors of their owne insuraing, and he ready entangled in the prepared net, which coming and artificiall indenour in a dogge (being a creature domesticall or househoulde serumunt brought vp at home with offails of the trencher and fragments of victualls) is not much to be martualled at, seing that a Hare (being a wilde and skippishe beast) was scene in England to the astonishment of the beholders, in the yeare of our Lorde God, 154 not onely dauncing in measure, but playing with his former fe

\*Of Englishe Dogges, | the diversities, the names, | the natures and the properties. | A Short | Treatise written in latine | by Johannes Caliaco | tare memo | fa, Doror of Phisickel in the United that the latine | by Johannes | fa, Doror of Phisickel in the United Phis | fa, Doror of Phisickel

Of the Dogge called the water Spaniell, or finder,

in Latine Aquaticus seuinquisitor.

wherein the producence and enectical working or interes is to be pondered.

Of the Dogge called the water Spaniell, or finder, in Latine Aquaticus seuinquisitor.

That kinde of dogge whose seruice is required in fowling ypon the water, partly through a naturall towardnesse, and partly by diligent teaching, is indued with that property. This sort is somewhat bigge, and of a measurable greatnesse, hauing long, rough, and curled heare, not obtayned by extraordinary trades, but given by natures appointment, yet neuerfulesse (friend Gesnar)! I have described and set him out in this manner, namely powled and notted from the shoulders to the himdernost legges, and to the end of his tayle, which I did for use and customs cause, that beying as it were made somewhat bare and naked, by shearing of such superfluite of heare, they might atchine the more lightnesse, and swiftnesse, and be lesse hindered in swymming, so trouble-some and needclesse a burthen being shaken of. This kinde of dogge is properly called Aquaticus, a water spaniel because he frequenteth and hath vsual recourse to the water where all his game & exercise lyeth, namely, waterfowles, which are taken by the helpe & service of them, in their kind. And principally duckes and drakes, whereupon he is lykowise named a dogge for the ducke, because in that qualitie he is excellent. With these dogges also we fetche out of the water such fowle as be stounge to death by any venemous worme, we ves them also to bring vs our boultes & arrows out of the water (missing our marcke) whereat we directed our levell, which otherwise we should hardly recover, and oftentimes the restore to vs our shaftes which we thought neuer to sectone or handle againe, after they were lost, for which circumstraunces they are called Inquisitores, scarchers, and finders. Although the ducke otherwhiles notably deceauch both the dogge and the master, by dyuing vnder the water, and also by naturall subtity, for if any man shall approche to the place where they builde, breede, and syt, the hennes

### Of the Dogge called the Fisher, in Latine

of the Dogge called the Fisher, in Latine

Can's Piscator.

The Dogge called the Fisher, in Latine

Can's Piscator.

The Dogge called the Fisher, whereof Hector Bothus

writeth, which seeketh for fishe by smelling among
rockes & stones, assuredly I know none of that kinde
in Englande, neither haue I receaued by reporte that there
is any suche, albeit I have been diligent & busic in demaunding the question as well of fishermen, as also of
huntesmen in that behalfe being carefull and carnest to
learne and vinderstand of them if any such were, except
you holde opinion that the beauer or Otter is a fishe (as
many haue belevaed) & according to their beliefe af
firmed, and as the birde Pinpine, is thought to be a fishe
and so accounted. But that kinde of dogge which followeth the fishe to apprehend and take it (if there bee
any of that disposition and property) whether they do
this for the gaine of hunting, or for the heate of hunger,
as other Dogges do which rather then they will be famished for want of foode, couet the carckases of carrion
and putrifyed fleshe. When I am fully resolued and disburthened of this doubt I wil sen you certificate in writing.
In the means escason I am not gnorant of that both Æbicanns, and Æbins call the Beauer Knnapotamion, a water
dogge, or adogge fishe, I know likewise thus much more,
that the Beauer doth participate this propertie with the
dogge, namely, that when fishes be scarse they leaue the
water and raunge vp and downe the lande, making an
insatiable slaughter of young lembes vntil they paunches
be replenished, and whe they have fed themselves full of
fleshe, then returne they to the water, from whence
they came. But albeit so much be graunted that this
Beauer is a dogge, yet it is to be noted that we recken
it not in the beadrow of Englishe dogges, as we baue
done the rest. The sec Calfe, in like maner, which our
country me for breuitie sake call a Seele, other more
largely name a Sea Vele nuketh a spoyle of fishes betweene rocks and banckes, but it is not accounte

" A Diall pertaining to the fecond Section.

#### HOW SOME DOGS SCRATCH.

THE replies to our request for the enlightenment of a Wisconsin man, who thought that dogs could not scratch themselves while standing up, have been num-HE replies to our request for the enlightenment of erous and entirely satisfactory. So many letters have come to us on the subject that we have been compelled to epitomize them in order to find any room for them at Following is the evidence volunteered on this momentous question :-

Editor Forest and Streum:—

11 Inda a setter, dead, as Horace Walpole would say, this last winter, at the possible age of seventeen or eighteen

years. In reading the paragraph relating to this ones

years. In reading the paragraph relating to this question to-night in the hearing of my family, we all recalled a frequent habit of our favorite (Grant) of scratching his neck and car, while standing up, with his right hind foot. It was especially a common practice with him after a scrimmage, when his ear had been bitten scre, and was kept so often for days in the summer time by this. I do not remember, however, to have observed in him or any other dog a similar attitude reproduced in the "cut" published in Forest AND STREAM.

A much more curious and uncommon occurence than this it was once my privilege to notice—that of a bald eagle scratching his head with himitable nonchalance during his flight. Some menths ago I was standing on the bank of the river, somewhat concealed by a hedge of codars, when I observed a bald eagle approaching at a height of some sixty or seventy feet above the ground. As he passed me at the distance of about ten yards he reached myward with his right foot, and simultaneously bending his head backward and sidewise, he brought the two into contact and continued to scratch his head during a very appreciable time, evidently with unaffected pleasure. Whether the act had more of a pecical than a political significance, or whether it was simply anti-parasitic, did not distinctly appear.

\*\*Editor\*\* Forest work Stream\*\*:

Editor Forest and Stream:—
Happening in the store of a friend, a customer was standing at the counter, while the clerk was wrapping up a cake of dog soap, the wrapper of which bore a cut similar to the one that excited your query. Calling attention to the cut. I suggested that it was unnatural, and after considerable discussion and the raking up of memories pro and con, the verdict was that a dog could not scratch and stand up at the same time. Just as we had settled the matter to our satisfaction and were about to separate, a fine sleek setter—one of a pair belonging to a gentleman down the street—cantered gaily past where we were standing and stopped probably ten yards from us. He shook his head angrily and then lifted his right leg and give his neck a vigorous scratch! The attitude was precisely as represented by the cut on the wrapper of the dog soap. Mutual significant glances were exchanged, but no comment.

C. E. C.

I may not be speaking out of turn or judged guilty of a presumptuous ventilation of knowledge if I arise to explain that I have seen a dog steach I masself standing up; and I have seen a dog stand up and scratch himself. When the advertisement first came to my notice I thought it represented the most grotesque and ill-proportioned our I ever saw, but asked no questions. I own a fine English setter, and claim for him as much canine segacity as is generally manifested by the majority of thoroughbred dogs, together with as large a crop of the Pulace irritans—notwithstanding much lathering with "Spratt's dog soap" and frequent-dredgings with "Steadman's flea powder"—as usually falls to the lot of one educated dog to care for. He is as glad as Tennyson's John when he is permitted to walk to the mail, and must be accredited with manifesting his delight full as clearly as the poet's Jack. This dog is often allowed to "fetch" the Forest and Stratan from the post office, and as soon as his master is comfortably seated he will mount the mearest chair (by permission) and patiently wait for the wrapper to be removed. To-day, a claim being in close proximity, he pecred over my shoulder while I was perusing No. 25, and searching the advertisements for a "highd," such as 13 vols. of Forest And Stratan for \$5, when Cathery's dog, with his tail docked short behind, met the wandering gaze of man and beast. And while hastily seanning the bill of fare for the purpose of selecting the first course of the rich repast before me, I read aloud, "Pray, ask Cathery if he ever saw a dog scratch himself standing up." The animal seemed to heed the prayer, for he at once took the floor and assumed about the same attitude as the picture delineates. The battle beautiful as the purpose of the each eattitude as the picture delineates. The battle the same attitude as the picture delineates. The battle character at the parager and the same attitude as the picture delineates. The battle character and the same attitude as the picture delineates. The ing the first course of the rich repast before me, I read aloud, "Pray, ask Cathery if he ever saw a dog scratch himself standing up." The animal seemed to heed the prayer, for he at once took the floor and assumed about the same attitude as the picture delineates. The battle raged flercely, and in the height of tunult he seemed to exhibit the same despairing look and some of the ungainly points of the newspaper quadruped. But the flea was still there.

gainly points of the newspaper quadruped. But the flea was still there.

On the premises is another of the canine family, a very fine shepherd. To-day my watchfulness was rewarded by seeing the two in consultation, and concluded they were discussing the petition of "J. A. T.," but was unable to learn positively, for in their training they were taught not to mouth their game. They did, however, of one accord and at the same time, stand up and scratch themselves. Since then I have found them frequently practicing the pose, and an now fearful that, not understanding the advertising dodges, they believe it high art and absolutely necessary for the completion of their characteristic dodges, they believe it high art and absolutely necessary for the completion of their characteristic dodges, they believe it high art can do a standard contraction. To disabuse their minds and free their bodies from the pest, I have applied very many preparations recommended as efficacious and guaranteed to kill, but with such discouraging results that I am most ready to give up in despair. The sympathetic chard has again been struck by the contortions of Cathery's dog, and gives new birth to the hope that there is a balm for every ill. I feel that if I wish to be counted as a man merciful to his beast my clear duty is to give this much-advertised soap a fair trial. Should it prove to be "a bane to fleas"—
"a boon to dogs"—I will let you know.

MAIRK.

A correspondent writing from the United States Marine Barracks, Annapolis, Md., under date of July 24th, gives his testimony with official exactness: "This morning, while on my way from the Maryland Hotel, in this city, to the Marine Barracks, I noticed a large black dog of the Newfoundland species so relieving himself from teas, without resorting to lying down. So impressed was I that I took out my watch, which was keeping correct time, and found it was exactly 8:30. The locality where I observed said dog was immediately in Iront of the newspaper store of Mr. Roger Rivers, ou the northeast corner of State House circle and East street." J. P. B., of West Boylston, Mass., says: "A gentleman pointed to the piece and wished me to read it, at the same time asking, 'Does not a dog often scratch standing up?" A setter bitch which was with me at that moment began to sexacth her left\_ear, standing, as if bound same time asking, "Poles not a dog orien strated statu-ing up?" A setter bitch which was with me at that mo-ment began to scratch her left ear standing, as if bound to put the answer "yes." G. R. M. writes from St. Joseph, Mo.: "If you watch a dog that has the mange you will find that be does scratch while standing up. I have been watching; to-day a<sub>h</sub>poor brute that is in that

condition, and have had an ocular demonstration of the fact." A Hammontown, N. J., observer has seen his dog do it repeatedly, and adds: "It must be an awful lazy deg, and an awful lazy man, that has to lie down whenever he wants to scratch." From Glen's Falls, N. Y., comes this: "No longer ago than yesterday (and before I had read your article) I called the attention of a friend to the ingenious way a little dog had of scratching himself, and a way I had never before remarked in dogs, although owning one most of my life. The little animal, standing alternately on his two fore legs and one him leg, balanced himself in such a manner as to use the unomployed him leg to scratch perfectly the outer surface of his belly—first the right side, then shifting, scratching the left side, all the while standing rigidly upon his left. A Newark, N. J., friend offers to send a dog to "J. A. T. and so demonstrate the thing. A Le Roy, N. V., man ancel biniself in such a mannerast ouse the unemployed belly—first the right side, then shifting, scratching the left side, all the while standing rigidly upon his left. A Newark, N. J., friend offers to send a dog to "J. A. T. and so demonstrate the thing. A Le Roy, N. V., man has a setter which he alleges performs the feat regularly three times in an hour and a half. A Beaufort, S. C., observer states that "a dog scratches himself always by standing up. He can only scratch his head when lying down, and he very much oftener scratches his head standing than he does lying down. No dog can scratch his held, or about his forelegs, lying down: he scratches his back by rolling and dragging his back along the ground. 'J. A. T.'s criticism is a farce; 'Cathery slog sop' notice is correct and artistic. All dogs scratch themselves standing up. Sometimes a dog, when lying down, will scratch bis head or ear. If standing up he does not lie down to scratch his car; if lying down he does not lie down to scratch his car; if lying down he does not lie down to scratch his car; if lying down he does not lie down to scratch his car; if lying down he don't get up to do it." All very well, but F. R. G., Laconia, N. H., says: "Have been watching my dog scratch this morning, and notice he sits down every time, and on thinking the matter over, don't think I ever saw one scratch in good faith to come to the 'scratch,' my celebrated setter dog. 'Doc' will accommodate him almost any time with a fair square 'stand up, 'go-as-yon-please' scratch. He does it with ease, with right or left hind foot, in true 'Cathery style,' and apparently with gratifying results,' "'Canis Scratchibus" "rough Latin, by the way) sends usa picture of how his dog does it, and thinks that "almost every doy." If any apparently with gratifying results," "Canis Scratchibus" rough Latin, by the way) sends us a picture of how his dog does it, and thinks that "dogs can scratch themselves while standing up. Citago, proverbially in for everything, contains one such anima It is now settled to the full satisfaction of our Wiscon-

sin friend, we trust, that dogs do scratch themselves while standing up, and the discussion of the subject is permanently closed in these columns.

-N. Elmore, of Granby, Conn., writes that be has sold all the  ${f z}$  beagle pups and foxhound pups, which he advertised a tew

weeks ago.

Signessful. Treatment of Snake Bites.—Dr. Upshauer, writing from Carrollton, Miss., July 15th, tells the Sun how he cures snake bites: I have practiced eight years in the Yazoo swamps. I have attended many cases of snake bite, both of rattlesnakes and moccasins. My treatment has invariably been to cut down freely with a bistoury, dilating the orifices made by the two fangs. After permitting a resonable amount of bleeding, I stuff into the wounds the dry salt of carbonate of atmonia. At the same time I give a tolerably strong solution of the same internally, say five to eight grains every fifteen minutes, until a drachm has been taken (less, if sufficient). Upon dissolving, the ammonia is rapidly communicated to the blood, and through it to the tissues previously visited by the poison. The latter, as is the case with all animal poisons, being of an acid reaction, the powerful alkali, on overtaking it, instantly neutralizes it, electroning its specific properties. I rely upon this treat-destroying its specific properties. destroying its specific properties. I rely upon this treatment always, and I have never had any trouble with such cases. The whiskey treatment is adjuvant only, and I attach but litte importance to it.

#### THE IRISH-AMERICAN MATCH-1880.

Now that the heat of conflict is over it may not be uniss in make some remarks in retrospect of the event of 1880 and the match at Dollymount, which is likely to hold for many a day its proud nosition as the climax of team shooting no hobb sides; and here I must contradict emphatically the assertions under by some reporters that the frish team was deficient clither in discipline or system. Such an assertion is absurd in the face of the soore achieved. In one of these accounts, reproduced in your paper, It is said that after their unfortunate opening at 1,000 yar's the Irish team showed their want of regular system, etc. The fact was so far otherwise that, in spite of an accident which might well have disorganized any team; namely, Milne's miss owing to well have disorganized any team; namely, Miner's miss owine to a bad cartridge, the trish in their subsequent shooting cleared off 7 points of the American lead, and were steadily overhauling them until the smoke episode, which cost them 4 points in Wen, Rigbty's score. It is curvious to remark that in 1853 and 1880 the Americans won the match at the middle range, and, accidents ex cepted, the shooting at 800 and 1,000 yards was as nearly equal a

As to Col. Bodine there is but one opinion here, and that is that he carried out the task confided to him in a masterly manner, He took in hand a team composed of heterogenous elements, rep-He took in hand a team composed of heterogenous eitinents, representing in some ways conflicting interests, and we, in this country, built some hopes upon these facts. We saw that they were not only practicing, but experimenting, and that some of their early experiments were at least risky; but the Captain quietly bided his time, and at almost the last moment nominated his team in a way which astonished those not in the secret. He put aside some whom we thought his very strongest men and retained one or two whose public records gave them little right to such a distinction. Having the option of shooting with eight men and every inducement to do so he widenced these for source. men, and every inducement to do so, he adopted the safer course and elected to put only it in the field. One of those affered a stated his opinion that if the selection had been made otherwise or even the squadding of those men differently arranged, victory would have been more than doubtful. I am mistaken in the gratitude of the American people if they fail to convey to Cot. Hoding their warm approval of the manner in which he accomplished the their warm approval of the manner in which he accomplished the difficult task imposed upon him. What disaster may befail a leader who, with less discretion, and without the necessary au-thority confided in him, attempts to fill the character of craptain of an American team, is well illustrated in this Halford-Hyde match at Wimbledon, the result of which will doubtless be to material winderdon, the result of white will doubtless be to cause such regulations to be made for the future as will prevent the repetition of a proceeding inconclusive and unsatisfactory in itself and tending to destroy the prestige of those granine and authorized international contests, which, properly and de-liberately conducted, are productive of excellent results,

menately connected, are promotive or excenent results.

As to reputations of individual shooting than any of those who visited us this year. Others have shot up to all that was expected of them, but in mastery of dillicult winds and in fund shots of exciting competitions, Dr. Scott has established for himself a of exciting competitions, Dr. Scott has established for himself a prilliant reputation both at Dollymount and Winhleddon. If his consummate judgment was accompanied by a little more promptness, he would be perfect as a long-range shot. He is unfortunately painfully deliberate at times, and those squadded with him have then need of patience. Among his successes lacer he numbers the Spencer cut, second drize in the Abercorn (second day) hers the Spencer cup, second prize in the Abercorn (second day) competition. At Wimbledon he achieved the unusual feat of capturing first prize in both stages of the Albert. Jackson was very successful in individual competitions, taking first prize in the Abercorn. Farrow won the Wimbledon cup and other prizes. Brown won the amateur cup at Wimbledon. Col. Clarke did not

Brown won the annateur cup at Wimbledon. Col. Clarke did not compete after the match at Dollymount, and Mr. Rathbone shot but little.

A word in conclusion as to rilles. It is not quife true that I was working at my breech-loader since 1876. I certainly tried many desultory experiments, but until the acceptance by the National Rille Association of America of our invitation, issued last winter, the Righy breech-loader did not exist. I at once put my plans into shape, and set to work to make the rilles. Every gun that I had made up to that time, numbering eight in all, and those, for want of time in an uninshed state, were in the bonds of the had made up to teat time, numoring eight in An, and those, for want of time, in an unthished state, were in the bunds of the team and reserves on the 20th of June. We had not at that dair a spare rille, if these eight men had been called on to shoot, but every one of them did their work well. It cannot, however, to considered a really fair trial of my system, seeing that each of the Americans had their choice of more than one rifle, and had w him at least one with which he was perfectly fam proved in all weathers. Yours respectfully, J. proved in all weathers. Yo Dublin, Ireland, Aug. 7th.

#### THE AMERICAN-CANADIAN MATCH.

CREEDMOOH, Aug. 11th.—The match to-day between the Canadian small-bore marksmen of the Victoria Club and the picked team of the Annateur Club, of New York, was short to-day and resulted in another victory for the Americans, and maintains imbroken the series of American team victories in all the Internabroken the series of American team victories in an top interna-tional matches so far. The Camadian team remained at the widow Klein's hotel, near the range, Friday night, and rose early in the morning to prepare for the day's work. The American team under the command of President R. H. Keene, its captain, wen under the command of President R. H. Keene, its capitale, went down to the range on the 7.35 o'clock train. The members were all in good health and in excellent spirits. The range was white with daisy tops, which dazeled the eyes like snow in the morning sun. Long green lanes extended down the field from the several fring points to the targets, indicating the track of the mower, which had cleared the paths for the rille bullets. The light was bad for shooting, however. The sun shone brillhantily for several minutes, and then a passing cloud shaded the field. President Keene and Lieut-Col. Gibson, capitalis of the American and Canadian reams respectively, assembled their teams at the 86 evests tiring points at 10 o'clock. The capitains tosed a cent raise. Canadian teams respectively, assembled their teams at the side yards' firing points at 10 o'clock. The captains tused a cent for the choice of targets, and the Canadians won. They chose targets O and V. The Americans took the targets adjoining Starmad VI, on the right of the Canadians. There was no referee and no watches sent to the butts. A. H. Cobb and Secretary Minor, of the Ama teur Ritle Club, spotted the dots on targets O and V, respectively. chalf of the Amateur Club. President Keene declared th on behalf of the Amateur Club. President Keene declared the match open at 10:17 o'clock. The American team was squadde as follows: L. Weber, J. P. Waters and Issae L. Allen on targe Star, with Col. Clark as spotter; R. Rathbous, Col. H. S. Jewel and L. L. Hepburn on target VI, with L. Gelger, of Hudson, a spotter; Liout, Col. fluson, Joseph Mason and Albert Pain, we

assigned to target O, with Jas. Adam as coach, while F. Schwarz Dr. McLaughlin and William Mitchell shot at target V, Major Fothervill coaching.

The luck which sent the Americans to the right gave them the advantage of being almost in line with the row of flag-staffs down the range, and they were at once informed of every variation of the wind by the shifting of the streamers attached to the shafts. The wind at the start was from the 0 clock quarter on the wind dfal, or from left to right across the range. This sent the smoke from the Canadian rifles across the American line of fire, but the smoke was very light. R. R. Keene, the captain of the team, was busy seeing that the men were not interfered with by the crawd, which was kept well back of the fring point behind a rope barrier. Both Americans and Canadians were provided with camp-stools and shelters to keep off the sun and bin, mils to curl upon when they shot, large field glasses mounted on tripods and easels for holding the miniature wooden targets used in "spotting" the shots.

used in "spotting" the shots.

Among the visitors were Judge H. A. Gildersleeve, President
of the National Rifle Association; Col. E. H. Sanford, of Gen.
Shader's staff; Major Joseph Scott, of the Second Brigade staff;
Col. H. G. Litchfield, of Gen. Hancock's staff; Adderman G. L.
Morse, of Yonkers; Dr. M. M. Maltby and a number of ladies.

The opening shots, after much warming up of guns by banging away with blank cartridges into the ground, were lited by Col. Gibson, Canadian, and L. Weber, American. Both were builseyes. The first round netted 28 in the possible 30 for each side, Allen and Rathbone, of the American team, dropping into "centers," while McLaughlin and Mitchell did the same on the Canadian team. The weather was then favorable for good work, and the men being in small squads tired quickly, one after another Each man occupied three or four camp stools with his outfit, while about him, as he sat rubbing the inside of his rifle between shots, was a collection of winding rods, with various cans of water and oil and heaps of russ. All of the men used breech-loaders of two American makes, and all lay on their backs while shotting. The Americans had the advantage of using heel sights, which gave them a loager base line between the back and foresight of the weapon. The Canadians used grip sights, which require steadler holding. It was manifest from the start that the Canadians were not working together, and that their rifles, though all of the same make, were not "averaged up" to be made available in helping each other. The nend dis one very line work, however, and three of them put in fourteen bullseyes out of fifteen shots at 80 yards. Only 4 "inners" were made in the 99 shots irred at this range, and every one of the builets went within the 8 foot square central section of the iron target. On the Americans idea there were but II points missing from a perfect score of bullseyes. Weber, after a "eenter" on his second shot, put in 13 consecutive builseyes, and out of the 90 shots 80 were bullseyes, while the Americans feld is points behind. But this was the greatest lead the charadians got. In the next round this lead was cut down to I point, which was held for the fifth round and then the Americans took the lead and kept it. At the fourteenth round they were 13 points ahead and at 11:15 the 80 yards Soloil folloid.

At that point the Americans led the scores by 12 points, and were "3 points ahead of the score made by the American team at Dollymount," as Capt. Keene exultingly exclaimed to his men at the finish.

At 11:30 the opening shots were fired at 1:00 yards. The Canadians opened badly, making only I bullseye, while the Americans made 3. They rapidly added to their lead as the bright sunlight gave way to a dull gray light, the sign of a squall or rain. Before half a dozen rounds had been fired, the rain came down in torrorst, obscuring the targets and compelling the men to huddle under canswa. After 10 minutes the petitor rain ceased. The wind had shifted down to the follock quarter, the temperature had fahen and it was necessary for the men to recalculate their elevations and windage. For a time the breeze came sharply and in gusts, but the sun was soon out again. It became generally a day of mixed conditions, and it required all the watchfulness of the coaches at the American targets to keep track of the elements. The Canadians failed to grasp these conditions except in an individual way, and except in the case of Pain there was a general break in their scores. "Inners" or "threes" hecame very common, and the visitors in one case got an "outer," the black disk coming up after one of Dr. McLaughlin's shots, to show that the builet had hit one of the wings of the target. It was the only "outer" made in the 500 shots fired during the day, and showed that the builet hit at least 18 inches from the object aimed at. The Canadians gave no sign that they were in the least put out by their losing battle, but went on shooting to the end with the quiet confidence of old rifle shot as a they are. The 800 yard scores had been 430 for the Americans against 427 for the Canadians, out of the possible 430. At 1900 yards the totals were 407 for the Canadian and 416 for the home tean, which added not more points to the lead at the first range, and made it in all 21 points on totals of 835 and 831 in the possible 900.

Up to this time and all through the match there was not at any time the least point of dispute between the teams, and this match was willhout referee to a purpose. The best of feelings, which had marked the intercourse of the two teams during the week before the match, continued during the contest and up to the moment of the departure of the visiting team for home.

of the departure of the visiting team for home. With the conclusion of the 300 yards shooting at 12:30 the teams went to hinch at the club-house on the range, while the targets were given new costs of black and white. The teams sat down to hinch together and passed a very agreeable hour, not, however, forgetting to exercise that frugality of diet essential to leaving the marksman's eye clear and his hand steady. The Canadians did not whis to encounter another shower, which seemed liminiment, and at 1:15 the shooting at the last range was opened with four "centers" on the Canadian side and two on the American side. Hepburn on his second shot astonished himself and his side by a miss. It was the first of the match, and was due to using too small an aperture in his sight. This blurred the target in the gray light then prevailing, and the bullet went over it into the bank. Hepburn quickly recovered, and made a good score at the distance, notwithstanding this mishap. The American shooting at the longest range was very good, including only three "inners" in the ninety shots. Allen on his fourteenth shot scored a "miss" unaccountably, and attributed it to a bullet pressed too far into the cartridge shell. These two misses brought Messrs. Allen and Hepburn into a te for lowest place in the American score. Waters came out ahead, having from the start relied implicitly on the judgment of Col. Clark, the coach at his target. The 416 total at the range showed that the home team had shot better after luncheon than before. The Canadians were slipping back further and turther, and not not of them at the last range

got into the seventies. No less than nine "inners" were made, and Pain, who had overy prospect of leading his team, in the haste of living off the last shot for his side sent it off the target into the bank and scored the only miss for his team, making in all three for the entire match. He was very greatly vexed over his missing.

The Canadian total at 1,000 yards was 401 points, making their total score 1,253 against 1,253 for the Americans, It was 3:15 when the match ended, and as the last shot was fired the spectators gathered around the marksmen. Col. Gildersleeve mounted a bench to amounce the result, and in doing as said:

oence to announce the result, and in doing so said:—
At the request of the Cantain of the American team, I have
the honor to announce that the Amateur Rifle Club ream bus
made 1,235 to the Canadians 1,235, the Amateur Club winning by
38 points; another victory for the Americans. In behalf of those
who have been witnesses, I can say that it has been most enjoysible. If the competitors have enjoyed it as well as the spectators, then we all have passed a most agreeable day.
Lieut, Col. Gibson said: "In acknowledging our defeat, we desite radge on in the mast reacold may have a made in the Markey and the spectators then we go in the mast reacold may have a made in the Markey and the

Lieut.-Col. Gibson sail: "In acknowledging our defeat, we desire to do so in the most graceful manner possible. We came down here, as I told you privately, Judge Gildersleeve, not to reverse the succession of victories which have been awarded to the American teams, but to have a good time with you, and we have exceeded in this respect our most sanguline expectations. That we have been defeated is no surprise to us, but that we have done so well is to us an agreeable disappointment. We congratuate ourselves that we have been able to put you to a little trouble, and that when we went back from the sol to the Life trouble, and that when we went back from the sol to the Life trouble, and that when we went back from the sol to the Life trouble, and that when we went back from the sol to the bope when we do the field of battle will be in our own country. When we do meet you there we trust we shall be able to treat you with the same generous hospitality you have extended to us. Thanking you far your courtesy, acknowledging our defeat and hooing there will come a team which shall defeat you—and I bave no doubt you share the hope—I will call for three cheers for the American team."

Of course the cheers were given, and the match was over, the Canadians burrying away to pack up in time for a speed home by the Eric express that evening. The results of the match are given in the following tables:—

This last match was brought about by correspondence between the Genera of the Aunateur Ritle Club of this city and the officers of the Victoria Rifle Club of Hamilton, Ont. These two clubs are known as the crack small-bore clubs of the United States and the Dominton. The Canadians have been able to hold their own well at Wimbledon and other British ranges, and have frequently beaten the expert shots of the mother country. The first American-Canadian match in 1875 grew out of a challenge from the Yictoria Club. The Cliffordsleeve team had just returned from

Ireland, and the Canadians were auxious to meet them. But a junior American team was pitted against the Canadians at Creedmoor, and won by a score of 1,460 to 1,384. In 1876 the Americans met their friends from over the border

moor, and won by a score of Light Decision. The American won the border against the Centennial match. The Americans have made at the Centennial match. The American fotals were Light and Lidit, against L409 and L483 for the Canadians, who made the lowest score of the five teams energied. In response to invitations from the Victoria Club a team of a Americans went to Toronto in Sept., 1877, and defeated the Canadian team by a score of L625 to L601. After this match the Canadians determined to lay soide their old muzzle-loading rifles, imported from England, and try American breech-loaders. Since 1877 they have been working hard over a system of team shooting. They made very line scores with their new weapons, and when early last spring the American culuisent a letter inquiring whether the series of Canadian-American matches should be resumed, the Victoria Club Stat word that they would come down to Creedmoor. Fing came on, and for a week past have been working at the Creedmoor ranges. On Wednesday last, when in a formal practice the scores of the eight Canadians fell 40 points behind the American score, many of the old Creedmoor shots thought the Canadians were "playing" possum." They were known to be line shots individually, and it was acknowledged that the victory would go to the hest disciplined team. Such was the event, and the Canadians were beaten, although they ran up a score far abead of anything they had done before

The Windledon Scandal.—The details of the irregularities of marking at Windledon cast a gloom over a meeting which in every other respect was a very commendable one to the British rildenen. Every one now is pretty well convinced that corrupt practices had prevailed at the present, if not at former gatherings, and that at least some prizes might have fallen into lands that dal not fairly win them. The melancholy part of the discovery is its comprehensive and retrospective operation. All those who have won prizes tainy of the meetings of the National Ride Association are more or less placed under suspicion, from which, honevable as they may be known to be in their own circles, it will be difficult for them to extricate themselves in the conclusions of the public at large to whom they are strangers. Thanks, however, are due to Private Runtze and Sergeant Sage, of the London Ride Brigad, for the courage they displayed in bringing the rumors of fraud to a practical test. The volunteers, without waiting for the judgment of the Court of Laquity which is investigating the charge made in regard to the marking for the Gudment of the Court of Laquity which is investigating the charge made in regard to the marking for the Gudment of the Court of Laquity which is niveligating the charge made in regard to the marking for the Gudment of the Court of Laquity which is niveligating the charge made as special entering the latest the superior of the further process appreciation of their "efforts toward exposing, and so for the future preventing, collusion between certain competitors and markers which has unfortunately discredited the meeting of 1880." This, it will be remarked, speaks in the plural, and volunteers in camp have made no secret of their ability to furnish cases in which high secrees have been made under such remarks, be conditions as to now lay them fairly open to doubt whether they could have been bequality of eases, the competitor knows long beforehand the day, the hour and the marker for the day and the hour and t

How often the thing has been done it is impossible to 'say, but that it can he done is certain. Indeed, the motios operand is not repudiated by markers themselves; for during the present meeting two or three of their number, traveling in a railway carringe with a non-commissened officer of volunters, candidly admitted that there would be no difficulty in making a good score for any particular individual. The curious thing is that the council of the association should have overlooked the possibility of fraud in this direction, especially as there are so many simple remedies at hand. Collusion, for instance, might easily be frustrated by the markers being kept in ignorance from gunif : to gunifer as to the targets to which they would be appointed, and further, by turning the men about whilst they were actually in the butts. This might involve some trilling delay, and some additional troublet but such considerations are of no account when the honor of an association which has been permitted to call itself "National" is at stake.

The only official action taken by the Wimbledon authorities up to this writing is embodied in the following notice posted on the Wimbledon bulletin board:

Wimbledon bulletin board:—

N. R. A. CAMP, WIMBLEDON, July 25th, 18-0.

It was reported to See arrive Committee that markers base in the property of the prope

What this Court of Inquiry discovered is indicated in the bulletin of Aug. 4th, which announced that on Aug. 6th ageneral court-martial will assemble at Forton Barracks, Gosport, to try Sergeant Marsham for alleged complicity in the false scoring said to have been then made.

### RANGE AND GALLERY.

Bostos, Mass., Aug. 44th.—There was a good attendance at Walnut Hill Range. Saturday, and some \$\psi\$ entries were made in the Massachusetts and Creedmoor matches. A squad of the Shaw Guards (colored) were on the ground and did some fine shooting. During the entire day the sun did not shine, consequently a nerfect light prevailed of the gray species, so much wished for by the marksamen. The wind changed but a few points during the shooting. The wind dial registered 9 to 10 colock, southwest. It was gentle and at no time gave any frouble. Only two matches filled, the 500 yards off-hand match and the amaterir matches unding no entries. Mr. J. F. Rabbitth's clegant achievement is worthy of especial mention. Starting his score with a "center," he kept in the bullseye for y consecutive shots, and nearly all in the middle of the bull, closing with 4g, and the best at that can he made. Making a refeatry, he again started with a bullseye and made 4, making a trefatry, he again started with a bullseye and made 4 and thing point with a determination to make a full score, but he omitted to 101 wis shell quad was recorded a miss.

Again reëntering, he made a good 48, scormuch to his chagrin ing in 20 shots 17 bullseves. The scores are as follows :-CREEDMOOR MATCH.

Sr. Paul, Minn., Ang. 1st -The St. Paul Ritle Club shooting grounds were formally opened this afternoon, the principal feature being a trial of skill between a team of 10 marksmen from each of the cities of St. Paul and Winona. The members of the Winona Shooting Club, to the number of 14, accompanied by several ladies arrived by the morning train and were met by a committee of the club and provided with quarters. At 1 p. M. the members of the club and beir guests from Winona, together with delegations from the Arion and Mannerchor singing societies, headed by the Great Uhion Band, harehed down Third street to the depot. Every arrangement had been made for the convenience and pleasure of those present. The weather was delightful. The exercises were opened by a modley of national airs from the Great Union Band, followed by a selection sung by the members of the Arion and Mannerchor societies. The president of the club, Mr. Arthur Koenig, then delivered the dedicatory address. St. Paul, Minn., Aug. 1st -The St. Paul Rifle Club shooting

The address, which was delivered in Gorman was listened to The address, which was delivered in German, was listened to with great interest, and both during its delivery and at its close was loudly applauded. These exercises being over a break was made for the shooting hall, and soon the riming reports of ville shots were head, the first shot being fired by President Koenig. Prior to the match between the teams from Whoma and St. Paul, the members from both clubs engaged in a trial of skill at builts eye shooting, which was not finished when time was called and the grand match of the day was announced. The two teams were composed of 10 from each club, each one of whom was entitled to list but a "The following is the name and score each." to 10 shots. The following is the name and score of each:

#### PRIVATE PRACTICE CLUB.

JUNE SCORES.

/ VIE Secretary feels like apologizing to the club for the long THE Secretary feels like apologizing to the club for the long delay in the presentation of this report. However, the Secretary is not wholly in fault, as several of the reports by members only reached bin after his return from the national meeting. The members attending that meeting will know the making of such a report upon the heels of the meeting is quite a task, and will pardon him for the brevity of his comments upon the June work. After all, the scores speak for themselves more clearly than any moralizing of his, and are the principal natter to which the attention of archers is drawn. One lesson, and a great one it is, taught by the last great national meeting, to which attention is here called, should surely speak more for the Private Practice Club than any words can do. At that meeting, out of the twelve prizes offered for the twelve greatest gross scores, eight prizes were taken by members of the Private Practice Club! Let who will, say that such a result could come of anything else than the prizes observed for the twelve greatest gross scores, eight prizes were taken by members of the Private Practice Club! Let who will, say that such a result could come of anything else than the systematic practice of the York Round adopted by this society. There cannot be a question that the fixed babit of preserving a record of every arrow shot will bring with it the babit of shooting every arrow carefully, as though the very reputation of the archer depended upon the result of each slot. Such carefulness always brings its reward, and the grand national meeting gives conclusive proof of its efficiency. Not only in the long-range work was this efficiency shown, but at the short ranges of the team shoot as well. The four gentlemen composing the team which won the first prize were all members of this society. The Wabish Merry Bowmen, who won the first prize at Chicago hist year in the team shoot, fell back to third place, with a very weak score, although the only member of the team who is a member of the private Practice Club (Mr. Will II, Thompson) scored 32 points bigher than any member of the winning team. The other members of the team, not having had the careful self drill which the Practed Practice Club necessitates, fell away below their idea of their own powers. But we desire to follow up this subject more fully in the annual report which will appear in the next issue of this paper, in which the Secretary will give the standing of the members up to the month of livic and a first prize of the standing of the members up to the month of livic and a first prize the standing of the members up to the month of livic and a first prize the standing of the members up to the month of livic and a first prize the standing of the members up to the month of livic and a first prize of the members up to the month of livic and a first prize of the members up to the month of livic and a first prize of the members up to the month of livic and a first prize of the members up to the other indea. more fully in the annual report which will appear in the next issue of this paper, in which the Secretary will give the standing of the members up to the month of July, and the awards to each, and will combine in the same report an account of the business meeting of the club held at Buffalo, with the amendments made to the constitution and rules, and the new classification of members upon the basis of the secores made in the month of June. He will only say to members who were not present, that because of some confusion as to the propriety of keeping the scores for July, it was decided to omit that month, and begin the new year on the 1st day of August. The Secretary will be thankful to members if they will mail their scores as soon after the close of the month as nossible. the month as possible

-----The formal opening of the Girard Cricket Club grounds, at Frankford, Pa, will take place on Friday and Saturday, Aug. 20th and 21st, by a match is. Young America. The grounds are situated between Kensington avenue and Frankford road. A new pavilion is in course of erection, with a seating capacity for 500

-The Oak Lane Cricket Club of Philadelphia, has been organ-Mr. N. H. Rand, Secretary.

—The game played on Saturday, July 7th, between the Onon-daga and Oswego Falls clubs, resulted in a victory for the Onon-dagas by 9 rons-score, Oswego Falls 40, Onondayas 18. Only one lonings each was played. For the Oswego Falls club, Ellis scored E; J. Backus 16 not out; and Shoesmith 11. For the Onondagas, Hallworth scored 18 and Millward 13.

-We have an indistinct recollection of having heard of the organization of a King's County Eleven, and should like to know if such an organization has been formed. Can any of our King's County friends enlighten us?

Country Friends enlighten us?

CHICKET IN THE OLDEN TIME.—In last week's issue we presented to our readers an illustration taken from a little book on the laws of the game, published over 109 years ago. We have since had a limited number of the cuts struck off on first-class paper, suitable for training and hanging up in club-houses. These can be had upon application at this office, for the cost price, ten cents each. As the reproduction of the little book has created an interest in cricketin clicks, we give below the title

—One of the extraordinary events in cricket this season was the small score (sixteen) obtained by Surrey against Nottingham. Twice only has it been equalled once at Lord's, when Surrey disposed of the Marylebone Club, in 1872, for 16 runs, and, in 1879, Nottingham put the Derbyshire eleven out for the same number of runs. Below we give the score of the Surrey eleven:—A P. Lucas, e Flowers, b Moreley.

mugs ever raced for from Portland down to New Orleans
The Yawa, Chopping Otr., Jr., Fruin B. Lawrence, of this
city, has rigged a new 25 four boat with an after sail in the shape
of a ligger, and to the astonishment of pe old time shellbacks of
the Battery, steered and worked his boat without touching the
heim. Slowly but surely the yawl rig is buginning to be appreciated and developed even among those who know nothing of its
custence in foreign waters.

More Than Likely.—If the new yields which has just been built for the Cata, after place drays by admiral Proof, is anything like the cross-table from class or when the triple like the constable from class or when the been been their children constructor has led the way is perfectly natural. Poport's boats look as though they had been built for the purpose of making a beeline to the bottom, and if they leave the purpose of making a beeline to the bottom, and if they leave the purpose of making a beeline to the bottom, and if they leave the purpose for a period of suspense. But if the Care wanted to avoid being but a period of suspense But if the Care wanted to avoid being but a period of the built was proposed by the Nibnist, Popolf was no doubt his man, -Phila. Noth. their con.

But the Rain warea of a root of the state. This, with interition Nations, Poport was no doubt his main, Thila, North interiESEX COUNTY CHALLENGE CUP.—The Expert, storp, 23ft. Hipmust be a fast eraft, or else her skipper knows how to make her
red the line off. She has won 7 rates in succession for the few
county Challenge Cup, and she well deserves to hold the cop as
property. Four of her races have already been recorded in these
columns. The fifth was sailed July 15th over a 7 rolle course, beatlog Hard Times in 2h. 5m. 38s. The sixth race was sailed July 24th

YACHTING BOOKS.—Many Inquirers are informed that a few
explies of the new edition of Kemps. "Yacht and Boat Sailing."
can be had of thos. Maming, 83 Boayer street, and that orders
for the hook must be sent had advance, as tho demand exhausts the
supply as fast as the printers can thrush.

VAN NOSTRANINS MAGAZINE contains for August, besides pa-

supply as fast as too pranters can turnism.

Van Nostranne's Madazins contains for August, besides papers on strains of bridges, etc., articles on the preservation of orron surfaces, the steel of the future, the pressure of wind and strength of stayed surfaces, which will interest many of our readers of a unchanical turn of mind,

The Anthacutz.—After a trip to Philadelphia she will return to England at her customary snail's pace of 6 miles about the last of this month. Concerning the failure of the Peckins Company to establish their extrawagant romaneing, facts will be found on our editoral page. The unwarrantable puffery of the Anthactle has become absolutely nauscating, and we trust, now that the whole system has been exposed for what it is worth in this journal, we have heard the last of her. Gone to join the steam catamarans.

narians. Duter—Parole has challenged Silence for a 10 mile to windward match for the money staked at the recent lay regists, when the cole looped over. Harry fill's prize our poes to the Trince on sail over, Aug. 8th. Excelsior failing to appear. The cup was affect for July 25th, but was fullshed acade heat... Dougan, correr of Nassau and Ann streets, is making the lasts for lots of activations.

occor crossau and Ann streets, is making the buts for lots of zealth screen.

Another Pallure.—By and by experimenters will learn something from these columns. We have only just circuncted the failure of the Voorhees steam catamaran, and now Mr. Merritt, of Poughkeepsie, crops by again with his last year's boat inkered and patched and makes a miles, probably about 6, instead of 39. Another enterprising "cuptain" of Nayack has got the fover very badly, with a single probably about 6, instead of 39. Another enterprising "cuptain" of Nayack has got the fover very badly will, of course, make 39 miles. Singular, this unaminally boat will, of course, make 39 miles. Singular, this unaminally pectations and then the lamentable failures following. If these would, be inventors and reformers would consult a navial architect for about 6 minutes they would save themselves money and being laughed at. Now, Mr. Merritt proposes substituting a compound engine, which is to be the great cure-all for his mrittetrap of a catamaran. Does Mr. Merritt know what a compound engine is

of a catamaran. Does Mr. Merritt know what a compound engine is?

WASHINGTON VILLAGE Y UCHT CLUE.—The annual regarits was sailed, Aug. Hith, in Old Harbor. Gem failed to appear as expected, and banneret was away on a cruise. In the center-boards pected, and banneret was away on a cruise. In the center-boards between the content of the wind, and from Half-tide Rock she gained, winning with plenty to spare. Among the keels, Violetta gottaway flist, and bisaketing Noupariel badly near one of the marks, the latter, inwever, winning on time. Judgees: Messrs, P. P. McDontatter, inwever, winning on time. Judgees: Messrs, P. P. McDontatter, inwever, winning on time. Judgees: Messrs, P. P. McDontatter, inwever, a much better custom to give all the prizes annuounced than to make any qualification as to "so many to cart or no second prize," a rule which, in the end, only serves to keep yachts away under an assumption that not enough will enter to known flyer may, under such a limiting chause, spoil in otherwise possible fine list of entries. Eureka and Nonparell took its prizes, fine marine clocks, and Unique and Violetta took a compass each, as second prize:—

Manning, 53 Beaver street; price about \$16; and Kedge Ancbor," from D. Van Nostrand, 27 Murray street; price

C. and B. F., New York.—If you want a safe sea boat rather than smooth water racer, build with a keel and put from into it. A

cutter of fair beam we consider faster than one of very parrow heam on a fair rule of measurement, such as multiplication of the three chief dimensions. Very much depends upon the indi-vidual boat, however. At all events, fair beam will give you more

room for less money.

J. B., Toledo, Ohio.—Can you give me instructions as to proper 3. b., Alleud, Onto.—Can you give me instructions as to proper tackle and baif for catching maskalongs with rod and line? How should they be hundled and landed when booked? Ans. Use a stout trolling rod, a multiplying reel and at least a hundred yards of good line with spoon and you will get more sport than trolling from a boat. Cast your spoon and play it from side to side. Handle your tish like any other; give line when you must, and bring him togaff when you can.

E. A. C., Philadelphia. – Is the Salmo oquasse an A. No. I game

E. A. C., Philadelphia.—Is the Salmo oquasse an A. No. I game fish, and where is it found? Please name its leading point for identification. What species of trout is that which appears once a year in big swarms in the Rangeley region and is accoped out in such numbers? Ans. No, it is not as gamy as your combination of letter and numeral is supposed to represent. Its common name of "blue-backed trout" porh pisrepresents its most prominent character to the angier. The mouth is smaller than in fondinals, fins large, except the adjoose dorsal. Seen from above the fish is blue; sides and abdomen of female silvery white; of male a deep orange. It is found in headwaters of the Androscog-gin, Rangeley, Oguasseo, Knepshago rivers, Mossemequutic Lake.

in Rungeley, Oquosoc, Kenebago rivers, Moosemeguntic Lake-ete. Your last question reters to this same fish. W. S. C., Wylie's Mill, Chester County, S. C.—I have constructed a pond, and want you to advise me in regard to stocking the same. My limited means will not admit of my going or sending same. My innited means will not admit of my going or sending to Washington for earp, if they have to be accompanied by some one to take eare of them on the way, and I know of none near me that could be had. I profer the earp, if they were within my reach or means. I think I would profer 'trout next to earp, but the same difficulty comes in with them, unless the eggs could be sent, and then I wouldn't know how to dispose of them in the sent, and then I wouldn't know how to dispose of them in the pond. Would our native troub the worth anything? or would the fish we eateh in our rivers, and called by us carp, be worth cultivating? Could the carp not be sent by express, at a reasonable price? I will impatiently await, your reply, and hope you will give me all the information you can. Ans. Your native "carp" is not the true article, and your "trout" is the black bass. For earp, write to Prof. S. P. Baird, Washington, D. C. It is doubtful if trout will live in your waters. If you reaf Fourst Ann STREAM you will get the latest information on fish culture. The books multished are minity on trout usture, except. A merican books published are mainly on trout culture, except "American Fish Culture," by Norris. The carp is undoubtedly the best

## ORESI @ OTREAM.

NEW YORK, THURSDAY, AUGUST 26, 1880.

FISHING AT THE RANGELEY LAKES,-We hear from the Rangeley Lakes excellent reports of the trout fishing, which is said to be exceptionally good this season. September is the month in which the largest trout are usually caught, and, though we do not altogether approve of taking the fish so late, as they are then preparing to spawn, there is usually a rush of fishermen to the lakes in the early fall. The Boston and Maine Railroad, in another column, publishes a schedule of fares which may be of use to some of our readers

A Fast Yacht,-Mr. Jas. G. Bennett's new steam yacht Polynia has turned out an exceedingly fast vessel. She beat the famous little Leila, of Bristol, last Thursday in Narragansett Bay. As the Leila is easily good for nineteen miles, the Polynia must have been making twenty, and, as she was not crowded, twenty-one or twenty-two are within her capacity. This makes the Polynia at least an eighteen knot steamer, and probably the fastest steam yacht in America.

-The suggestion of a correspondent that the stations and baggage cars of the railroads entering New York be posted with the law probibiting the carriage of snared game and game killed out of season, is simple, sensible and practicable. The plan, if adopted, will undoubtedly do very much to lessen the traffic in this plunder. Let it be tried. It will at least accomplish more than an afterdinner-speech.

THE AMERICAN ASSOCIATION MEETING .- The twentyninth meeting of the American Association for the Advancement of Science commenced yesterday at Boston. This meeting, of which Mr. Lewis H. Morgan is President, promises to be very largely attended and very successful, and we shall hope to give some particulars of it in next week's issue of Forest and Stream.

#### HOW TO STUDY NATURE.

H UXLEY modestly calls his book\* an introduction to the study of zoölogy, but the reader who obtains a few crayfish, or crawfish, as we Americans prefer to call and spell it, and takes note of their outside appearance as described by the author, and afterward dissects them according to the very plain directions laid down, will find himself a zoölogist by the time he lays the book down, and will then be qualified to take up a bird, beast or fish, and describe it, or at least understand it, its structure, movements and all that comes under the observation of a trained naturalist. O that such a book had been written years ago! What months and years of pottering it would have saved us! The common crayfish of our fresh waters is a most wonderful animal to those who study it first, but it is not a bit more wonderful than others, and its study will only prepare the stu dent to go farther; will tempt him, in fact, and he, or she, will find the desire to learn more grows and takes possession of one like an evil habit. This book, written by one of the greatest living zoologists, is a valuable contribution to our small list of really good primary zoölogical text books, and the story is most simply and charmingly told, being as free from all strange terms as it is possible to be and yet be explicit, although, as a matter of course, the reader must learn a few names of parts of whose existence he was before ignorant. He begins by telling us that many persons seem to believe that what is termed science is of a widely different nature from ordinary knowledge, and that the methods by which scientific truths are ascertained involve mental operations of a recondite and mysterious nature, comprehensible only by the initiated, and as distinct in their character as in their subject matter, from the processes by which we discriminate between fact and fancy in ordinary life, and that what is called science is only that common sense which sees things as they are, or, at any rate, without the distortions of prejudice, and reasons from them in accordance with the dictates of sound judgment,

After giving a description of the external parts, accompanied by a plate on which letters refer to the names of the parts, its movements, food, habits, method of capture, etc., he says: "Thus far our information respecting the crayfish is such as would be forced upon any one who dealt in crayfishes, or lived in a district in which they were used for food. It is common knowledge. Let us now try to push our acquaintance with what is to be learned about the animal a little further, so as to be able to give an account of its natural history," etc. And thus he leads the reader along into the mysteries of the structure, of its shell or exoskeleton, the attachment of its legs and swimmerets, its jaws, gills, circulation of blood and its digestive and generative organs, until finally there seems nothing more to be known concerning the individual.

It must be borne in mind that it is the common crayfish of Europe which he is describing, and that we have several species in different parts of our country which differ in shape of claws and other particulars which are really unimportant as the European animal is the type of the family, and although the common crayfish is the title, and its life history and structure the main part of the book, all the relatives of the animal, such as shrimps, lobsters and crabs, are considered, and their peculiarities treated of, so that one gets a good idea of all the crustacea at the same time, and getting it, so to speak, from the fountain head, he is sure that what he is learning is what is accepted as truth by scientists in all lands,

We have had so much stuff offered to the public as popular natural history, which was compiled by men who did not even know who was good authority and who was not, that we regard it as the sign of the beginning of a new era when men like Huxley begin to write books for the people instead of only for the learned. The publish-

The | Crayfish, | an Introduction to the Study of Zoology, | by T. H. Huxley, F. R. S.,—with eighty-two illustrations, | New York: | D. Appleton and Company, | 1, 3 and 5 Bond street, |

ers (Appleton & Co.) have published many of the workof modern scientists, but we doubt if any volume of their "International Scientific Series," of which the present volume is the twenty-eighth, will do more toward awakening an interest in the study of the life by which we are surrounded, and a knowledge of which is really necesary in order to form an idea of man's place in nature, than the present one.

THE FALL MEETING PROGRAMME. - The very moderate and unpretentious list of competitions for the eighth Annual Fall Prize Meeting at Creedmoor has been is sued and may be found in our rifle columns. There is plenty of variety in the competitions, however, and riflemen who shoot for the pleasure of the art may find plenty of chance for enjoyment in the few days of the meeting. Reduced into plain, hard figures, the prize list is a meager affair; very much so. nothing to tempt the grubbers for gain, who make the rifle a lever for their purposes of self-enrichment. There are simple badges whose value ranges far above their intrinsic worth in the eyes of their holders, because they represent an achievement, a victory won. and a struggle successfully gone through with.

With the true sportsman's idea in the minds of the contestants, it would be sufficient to prepare a programme of matches to secure a roll of entries. If it is necessary to bait the programme with a liberal prize worm, or to sugar-coat the shooting conditions as though the match were a nauseous affair only made endurable by an addenda of liberal prizes, then it were better that no match should take place. The National Rifle Association is not fulfilling its object—the encouragement of rifle practice—if it is only to act as tubmonitor for a set of greedy cormorants who flock about to pick over the good things of the feed set before them. The programme for the September meeting will afford little satisfaction to these gentry. To lead in a match brings honor, but little profit, and this is as it should be, if we are not to have the logical result of liberal prize lists as instanced in the recent Wimbledon false-mark ing scandal. The prospect already points to a good meeting. The meeting between the regulars and the militia will be more nearly on an equality than at any previous time. The men of the army have been working up, anxious to show the people generally that they, as professionals, are not ridiculously behind the amateurs of our State regiments. The meeting gives promise of good management under Col. Bodine, and, with a fine spell of weather, there is a prospect of a deal of good work in the several contests.

FAIR DEALING FOR SPORTSMEN,—The letter about Cobb's Island is a sufficient reply to our request that its author should tell us about the present accommodations there for sportsmen, and our Poughkeepsie correspondent is doubtless as much pleased as we are ourselves have such an explicit account as that given by "Chasseur." Cobb's Island is not by any means the first place which has ruined its greedy managers and obliged them to come down to a reasonable scale of prices. We never knowingly recommend to our readers a place where extortion is the rule; but now that the landlords at Cobb's Island have reformed in this respect, we can indorse all that is said in praise of the sport to be had there. The columns of the Forest and Stream are always open to praise of resorts which deserve good words, and to the exposure of other places where the sportsman is fleeced: and it always means to ascertain the true condition of affairs and do justice to all. We will thank our correspondents at all times to bear this policy in mind and to aid us in carrying it out.

-A Baltimore child clairvoyant has discovered the North Pole, which she describes as an island, full of tropical trees and flowers. There are also vast hordes of monkeys, ostriches, swans, geese, ducks, quail, robins and humming birds. Rather an inviting field for a good dog and a breech-loader. Perhaps when the other game fields of the world are exhausted, the sportsman may be "first in" at the Pole.

### The Sportsman Courist.

CAMP NOTES.

TO RODINES

[Continued from page 46.]

ICOntinued from page 46.]

WALKING along the mountain road, admiring the lovely wild flowers and the immense moss-covered rocks over which water is trickling to bathe and refresh the charming little forget-me-nots that there abound, I take a path worn smooth by the wanderings of grazing cattle, whose bells are heard (inkling not immusically here and there, and following in its numerous windings down the mountain side, come suddenly upon the long, still pool where the trout I am in scarch of has his abiding place. There, under a large boulder in the middle of the pool, is his lair, from which position he rose, but missed my fly, the day before. He's a rouser, and a wary old fellow, smarting under the remembrance of sundry pricks from the fishermen in camp, and must be carefully approached. I start in at the foot of the pool and wade carefully toward the rock, never taking my feet from the water, to avoid a splash that would send wavelets up the pool to notify him of my coming. I am within a hundred feet of him, and commence to east my him toward the spot, approaching gradually, and unreeling the line the while to give the longest east of which I am capable. Presently the flies are sarting over the very point I would have them: and as they alight upon the water softly, gently, every herve thrills with expectancy and excitement. There is a small ripple seen, then an involuntury strike, and a miscrable little black-speckled chub is reeled toward me. He is contemptuously disengaged from the hook and thrown solver, which directions to remain there as food for minks. How one will "talk to himself" when thus addse upon the stream. Many interesting conversations have I held with birds and trout, and quite entertainingly have they replied to me. Aly ties are again in the air; the line is lengthening, and the next east will send them to the very spot. There they light again, but no respense rewards my endeavor. I cast all about the rock, under the neighboring busiles, and near the head of the pool, inquiring the while in finally conclude he has discovered me, and he being the particular fish 1 am after, with nothing else to do, I wade carefully ashore, sit down upon a mossy rock, with feet daughing in the water, lay down my rod, light my pipe, take out my note book, and jot down what I see, hoping that while thus engaged my victim may exhibit bloosely in feeling on the natural flies that are bobbing

pipe, take our hyrote bons, and pot down what see, hoping that while thus engaged my victim may exhibit himself in feeding on the natural flies that are bobbing over the water.

What counties living creatures one encounters when sitting thus quietly in the woods. Birds hop about in the branches overhead, twittering and chattering to one another while looking down upon you in a comically suspicious manner, almost asking you what you are up to anyhow. Fly-catchers dart from the trees, and with uncering aim capture the nooths and flies that are skipping about. Kinglishers dive for minnows and newts close by your feet, throwing water in your face from their plunge. Highholds regale their young with gruts that they bring momentarily from a neighboring meadow. Little speckled woodpeckers search for insects and larven in the bark of the surrounding trees, giving wee grunts of satisfaction every time one is impaled upon their barbed tongues. Frogs of all sizes, with voices from that of a deep baritone to the shrill treble, give out their single, jerky notes as though fired from a pop gun. Butterflees take their tortuous flight through the denso thicket and over the tree tops without ever touching a branch—a feat that would seem impossible as you look upon their course. Ginats, punkies, mosquitos and flies alight upon your face and hands, taxing your fortitude to the utmost in avoiding spatting them, that you may not frighten away the birds. The mosquito, like the rattle-snake, gives warning before he stukes, but the punkie is a contemptible copperhead, biring before declaring himself. Ants and brightly-colored becles scamper across your paper, arresting your writing that you may scrittinize and admire them. An ant is a colportent of no mean description. He can carry many times his own weight, but is a confounded fool in getting it there. He never turns aside for any obstacle in his way, never seems certain as to where he is going nor why. I have just been watching one back up a tree with a dead bug in his mandibles, wh feet; as no pokes listicisty about over the bottom of the creek, sucking sand and mud into his long snout and inmediately squirting it out again, causing a dirty cloud all about him, and then moving on, overturning sticks and rooting under stones, forever looking for something that he never finds, apply reminds me of men seen upon our streets at home, lounging about the corners sucking filthy clay pipes and expectorating tobacco juice about for their betters to walk in, then moving on to get out of their own fifth and to bespatter and masty a new neighborhood. While observing the sucker a muskrat has quietly taken a seat on the very rock under which my frout is supposed to be, confound him! There he sits, unconcernedly breakfasting on a bunch of clover which he has brought with him. Now he swims gracefully down the pond, climbs upon an old log, and washes his face with his black paws. There he will play and frolic within reach of my rod until I stir, when in a twinking he will be gone, and, for the life of you, you cannot tell where. He has the power of becoming invisible in clear water not possessed by any other, creature of my acwater not possessed quaintance. I note where. He has the power of becoming invisible in clear water not possessed by any other creature of my ac-quaintance. I note the wood robin (Turdus melodus) does not athere to his accredited time for singing. He is thought to give forth his exquisite melody only early in the morning and late in the evening; but here I have heard him at all hours of the day, Just below me, by the water's edge, I hear a plaintive, pleading cry of some creature in distress. I must see what it is, even at the risk of disturbing the trout and driving away my inter-

esting friends. No one should fail to respond to such an appeal as that. Poor froggie I it's you, is it? And that ugly water snake has you by one hind leg. Cause enough for alarm and that wild wail for succor. While I searched for a stick the snake was vainly endeavoring to turn the frog so as to get his head in his mouth. The frog resisted desperately, kicking with his free leg and calling on me piteously for help. It came with a whack over his snakeship's back that sent him writhing into the water and set froggie free, who made some marvelous leaps down the bank and disappeared under a stone in the pond without waiting to express his thanks for the rescue. While returning to my seat a porcupine appears at the margin of the pool, and, not seeing me, occupies himself in overturning stones with his great black paws. He seems to be searching for harve and crabs, for momentarily he sits erect and conveys something to his mouth with both paws. Having examined the shore upon his side of the pond pretty thoroughly, he looks across to mine, scrutinizing the premises as though anxions to investigate that also. To my surprise he enters the water and swims directly toward me. He is an ugly-looking chap, but quite a graceful swimmer. As he nears the shore I wade out to meet him, at which he does not exhibit the slightest concern. His quills all lay smoothly upon his back while he swims, and he seems to be unable to creet them when I poke him with a stick. Evidently lavor him at a disadvantage. I thrust him under the water; he turns over once or twice from the pressure of the stick, and rises almost exhausted to the surface. He's the most helpless creature for so large and homely a one that I have yet formed an acquaintance with. I am tempted to grasp him by one of his hind feet, but an dissuaded by the close proximity of his bushy, bristing tail, and push him ashore, where he lies utterly used up and grunting as though in great distress. Soon he revives and shows a disposition to crawl into the bushes. I touch him with a esting friends. No one should fail to respond to such an appeal us that. Pour frontial it's you is it? And that in a manner that caused me to congratulate myself that the stick and not my hand received the blow. If vong played with him to my satisfaction, and concluding he would never make a "boson" companion," I left him to seramble into the thicket while I once more regained my

seat on the rock.

Scarcely had I noted my interview with the porcupine in my note-book when the very trout that I had been waiting for broke, almost under my nose. There he is now, with head turned up stream, his side toward me, upon which every vermillion spot us plainly distinguishable. His tail moves slowly from side to side and his pectoral fins fan the water continually. Even his coneshap d pupil can be seen, so close is le. What a heauty lee is! He seems conscious that a foe is near, for his eye moves restlessly, and he makes several hesitating motions as though he would like to capture a natural fly that is fluttering in the water near him. He starts toward is saddenly, then returns to his position again, evidently with one eye on me and the other on the insect. I sit motionless, and cautionsly and slowly reed up my line until only the leader hangs from the end of the rod. I wait, and when at last he darks at the insect that has I sit inotionless, and cautionsly and slowly reel up my line until only the leader hangs from the end of the rod, I wait, and when at last he darts at the insect that has been enticing him, making the water boil as he engulfs it and swittly returns to his old position. I conclude my time for action has arrived, and tremblingly extend my rod and drop the end fly upon the water just over his head. His fins vibrate more rapidly, his tall moves nervously, giving a peculiar spiral motion to his body; he starts toward the bobbing fly, then turns back again; he comes again, this time with more determination in the movement, and I hold my breath and tremble in every muscle with a feeling that my body will fly to pieces if he keeps fooling with me much longer; he turns swiftly, just as h: comes within a foot of the fly, and concludes he won't. I give a sigh of relief, unixed with approval and disappointment; every nerve in my body is quivering, and I feel as though f could leap into the creck and end the contest. The trout still moves about restlessly and watches the fly. He makes sundry feints at it, which sends my heart and lungs into my mouth, almost suffocating me. I swallow them as best I can, when he turns away and I continue my bobbing desperately. A trembling, incautious movement of my arm lets the dropper-fly upon the water, and, before I can get it away, that confounded trout has if fastened in his jaw and is skedaddling up the pond with it at a rate that makes the red sine with us ranid read into me. dropper-fly upon the water, and, before I can get it away, that confounded trout has it fastened in his jaw and is skedaddling up the pond with it at a rate that makes the reel sing with its rapid revolutions. Before I can Jump into the pool and prepare for the fight, he leaps from the water twice, shaking his head desperately, and creating such a splashing as to send the suckers darting by me in affeight at the unusual commotion. But I have him—fast have I him too, in his upper jaw, with no danger of release, if tackle proves true and strong. No use in your shaking your head in that manner, did fellow, you must come to creel this time. Steady, there! You shall not reach that stump—that will never do. Whoa, just missed it, by graeious! Well, you are a lively chap: shaking your head in that manner, old fellow, you come to creet this time. Steady, there! You say a reach that stump—that will never do. Whose missed it, by gracious! Well, you are a lively want to get under that rock, hey? let us see about reach that stump—that will never do. Whoa, just missed it, by gracious! Well, you are a lively chap; want to get under that rock, hey? let us see about that; just pull on the spring of that rod a while, and we will see who is the strongest! Ah, ha! that brings you to terms, doesn't it? Ready to capitulate? Very well, just let me slip this landing net under you. No? All right, try it agan; but that brush heap you shall not reach unless you break my well-tried bamboo. Tired again after that splurge, are you? Well, we'll try the landing net once more; let me reel you in a little first; there, now you are within reaching distance. What a beauty you are, and what a pity it is to take you from this charming pool! How your silver sides reflect the colors, and as I lead you into the sunlight how you charge to gold and ruby and emerald and—bless me, every other color worth admiring. What a bright carmine your fringed gills are, and how your pink this barmonize with your general "make up." A noble fight you have made, my dear fellow, and a very handsome fish you are. There, rest upon that tutt of grass in the creel, while I try your mate under the willows yonder; for, from the manner in which he is just now splashing about, I conclude he can be made to keep you company. Then, what a handsome

brace you will be to exhibit to the campers as trophies of

brace you will be to exhibit to the campers as trophies of my morning's work.

What a picture is revealed to me as I wade out into the stream. To the left, a rock-bound shore overhung with long green branches of the water-beech. Through them are seen the rhododendrons, their pink and white clusters peeping out everywhere. In front, a miniature falls gracefully rippling and winding among and over moss-towed rocks. Beyond, a smooth sheet of water, under which every stone and pebble can be seen, and from the quiet eurface of which the mountain and sky is clearly reflected. To the right, willows with their yellow following, which were which spruce and henbock with their darker shades of green. Along the bank a decaying log, completely covered with moss, and through which delicate ferns are growing; belind it, in swampy ground, a cluster of cardinal flowers (Lobelia eurolinalis), almost a mouth in advance of its regular blooming time, and whose bright scarlet blossoms appear all the lovelier by reason of the becoming background of tall green finiothy stalks that wave to and fro in the gentle breeze. Dailes, with their round, full faces—so suggestive of good humor and joility—abound everywhere. No glen is too dark for them, no meadow too light, no sandy plain too hot or dry, no swamp too wet or cold; the ever cheefful disky looks up at you from meadow, bill and dule; among the first flowers to greet you in the spring, the last to hid you adieu in the fall. Bless the daisies! In the meadow I see tall purple plumes of the iron-weed (Vernononia note-borocensies) and wild sweet william (Phlox maculata), with sprinklings of yellow and gold from the buttercups and princroses (Primala occidentalis). The air is fragrant with the perfune of the now blossoning milk-weed and nusical with the warblings of the thrushes. Overhead, through the graceful branches of the trees, the clear blue sky, with white and fleecy clouds wafted hither and let me free to catch that trout.

Hallon, what sound is that? I hear it once again in an ech

riedly under the bushes and have a rise, at which I strike nervously, and carry away the upper lip of the lish, who, freed from the hook, darts out into the pond and rests within easy view. He rubs his nose against a stone, opens and closes his mouth, winks and blinks and seems to be meditating upon the situation; to, perbaps, wondering what sort of an infernal fly could carry away a fellow's lip, Just then he got a glimpse of ne, and darted up the pond like a recket, and was gone. Concluding he had enough of me for that day, I recled up my line, climbed to the mountain road and hurried into camp.

### RAIL SHOOTING ON THE DELAWARE.

HESTER, a town of some commercial importance, situated on the Delaware River not far from Philadelphia, is now, and has been for years, the headquarters for sportsmen devoted to this kind of shooting, and as there are many fond of the pursuit of upland birds—woodcock, grouse and quail—and again many to whom the (to me questionable) excitement of shooting ducks, geese, etc., offers attractions, so there are those who for years and years in succession are to be found at the proper season at Chester, as eager for the sport as though it combined all the attractions of both.

The best time for shooting occurs during the high tides.

gees, etc., offers attractions, so there are thosa who for years and years in succession are to be found at the proper season at Chester, as eager for the sport as though it combined all the attractions of both.

The best time for shooting occurs during the high tide of the full September moon, for, other things being cqual, the higher the tide the larger the bag.

Itaving obtained a "pusher" at Chester, you stard about an hour before the tide rises, and cross the river to the flats, and are pushed by your boatman as far up into the reeds as the tide allows you to go. With your derkey pusher at the stern with his long pole, you stand firmly braced in the stern with his long pole, you stand firmly braced in the bow. If you do not get excited, the chances are, if you are a tolerable shot, that you will kill almost all your birds; but, as for retrieving them, that depends on your boatman. Left to yourself, you would not find one-half the birds hit.

You may think you mark the birds down, but the bunches of reed are so much alike that two to one you never see your bird again, although he may be not a foot away, clinging to some hidden weed with but the end of his little bill above water. But, with a good pusher, whose eyes are accustomed to discover the minutest difference in the color or size of a reed, you will probably lose but a few birds, except wounded ones, which you may as well give up at once. Apart from the natural repugnance of a true sportsman to kill and not retrieve, you will do better to leave them, for in the ten minutes you consume in searching you may shoot five or six birds. The time of shooting does not exceed three hours a day; but the immense quantity shot in that time would make one think that the birds would soon be externinated. Not so, however, for although it is not unusual for a single boat to bring in one hundred or more birds, and the flast during shooting hours are covered with boats, yet year after year the rail is found seeningly in numbers undiminished from the thousands of shots d

nats.

However, as a means of relaxation, if one is willing to incur the danger, it will help to pass the time between seasons. The birds, when shot, are small and hardly worth

powder and shot when compared to the birds of 'our uplands; but there are those who consider the rail as only inferior to the reed-bird as a delicacy for the table, and we must confess that a nicely broiled rail is not to be

sneered at.
If you go rail shooting do your best to be "high boat,"
i.e., kill and bring home the most birds, and ever after
you will linger in the remembrance of the pusher, for it
is something added to his reputation to have "high boat,"
and the chances are if you ever go again you will be received with a welcome.

D. F.

#### ALL ABOUT COBB'S ISLAND.

WARRENTON, Va., Aug. 13th, 1880.

Etitlor Forest and Stream:—
I see, in your last issue, a card from a Poughkeepsie man disputing my account of Cobb's Island, and rather rearcastically asking for further information. For his benefit, as well as your sportsmen readers, I will give a brief history of the famous sporting resort.

Many years ago—when you, I and the wearied proof-reader who revises this were boys—there dwelt in a shanty on a barren sand bank, that had risen, like the falled isle Calypso, from out of the depths of the ocean, a rough, weather-beaten fisherman named Cobb, who gained his living by casting his nets us well as shooting ducks, wild fowl and greese, vast quantities of which, in the winter, flocked to the great Broadwater region lying near. When he first bought his domain it was but four or five acres in extent, and the price paid was \$30 in gold and ten bags of salt. Never was money ever placed to greater advantage, for Old Neptune, generally so merciless and cruel, and who remorselessly gathers in much of that garnered wealth that is seeking other climes—yet sometimes in his royal humor gives a royal gift—and this simple fisher, like the one in the Arabian Nights, was in luck. Day by day, hour by hour, by the cease-less, restless action of the waters did his island increase; and nature, to ward off all danger of its being swept away by a tidal wave, formed breakers, in the figure of a half moon, that broke the strength of the northwest waves, and shattered them into harmless foam when they struck the island. It is a sight to see those billows in a high wind—racing one behind another like crack horses strung out in a sixteen mile race—coming in on the home stretch, and then dashing themselves against the bar with a noise like the booming of distant artillery. In

"The league long roller thundering on the reef"

with a noise like the booming of distant artillery. In calm weather it sounds like a monody played in low numbers, and

"The league long roller thundering on the reef"
seems a requiem to many a poor fellow who sleeps his last sleep on the island, for Cobb's Island soon became a wrecking station. On this dangerous coast many a stately ressel has been dashed to pieces and their crews drowned in the vicinity of this island. Indeed, the old man Cobb said his stalwart sons made many thousands of dollars salvage from wrecked vessels, as well as rescuting many lives. In one slip alone, that went to pieces on the island, their share of the profits of the cargo they saved mounted to \$8.000. All that is over now, for there is a United States life saving station on the island, under charge of Mr. Cruopy, who, by the way, is a genial, fine-souled fellow.

Time passed on—as time, that maddest of wags, will always do—and from a little sand bank of only a few acres, old man Cobb found himself possessed of a dominion of several hundred. Trees land grown up, gardens been laid out, and his boys, becoming men, became, as was natural, ambitious; and disdaining the humble life, and its sure but slow gains of their progenitors, they determined to spend the few thousands they had carned in their dangerous calling by fitting up a watering place. They built a hotel of that rambling style of architecture known as the Viriginia tavern, also a few cottages. A wharf was constructed, a tugboat purchased to bring guests from Cherrystone, and then the place was thrown open to the public. A great rush ensued, and the island, from its varied attractions, soon gathered a large crowd. My first visit to the island was four years ago. I was then the Southern correspondent, as well as writer of sketches and tales, for the Forest AND Stream, and if the gentleman from Poughkeepise will turn to its columns he will find that I was unsparing in my denunciation of the management of Cobb's sleand. In truth, affairs were in a bad way. The Cobbs themselves,

man Cobb and reopened the place in a quiet way, and, being a sensible man, he has remedied all the former abuses. There is absolutely no extortion, and everything is open and without guile. The rates of board are cheaper than any resort on the Atlantic coast, be ng \$30 a month, \$12 per week and \$2 per day. So far from the guides charging sportsmen anything they want, there are printed schedules of prices hung up all over the hotel. I copy one:—

Guests desiring guides will find the following prices: For shorting on a tide, one person.

For isking, each person.

For isking, each person. SPAUY & CORB. Proprietors

Thus it will be seen that the charges are very reasonable. The guides furnish everything, decoys, boats, etc., and as each hunting trip lasts several hours, generally a half a day, they earn their money by the hardest kind of work. I know of no manual labor that is equal to their decisions are all the second of work. I know of no manual labor that is equal to their duties of crouching close behind a blind on a salt meadow, with the blazing sun beating down, straining your eyes to catch sight of the birds, so as to whistle them to the decoys, and almost blinded by the dazzling glare, and then classing wounded birds, often waist deep in water. All this in cold blood, they not having guns, and, of course, not being braced up with the excitement and stimulus that the shooter feels.

In the winter the board at the hotel is the same as the summer, and the charces for a day's duck and weeps shoot.

In the winter the board at the hotel is the same as the summer, and the charges for aday's duck and geese shooting is \$3 per day; and never once during the last summer or this did the guides claim any of the game killed. On the contrary, they would cheerfully pack them in ice and send them off as directed. I forwarded all the bird's I killed to friends, and heard no protest. I know it is but right as regards winter shooting, that the shootist should have all the game he kills. If I see a disposition in any public place to victimize sportsmen I would be swift to brand it through the press.

The guides at Cobb's Island, for the most part, are good-natured. Kind, and, as I wrote in uny last, thoroughly

matured, kind, and, as I wrote in my last, thoroughly honest. Thave often left valuable things in the boat, and totally forgotten them, but they have always been

returned.

There are all kinds of people in this world, a remark you have probably heard before, and there are various grades among the sportsmen, as well as any other class, and I have seen some mean men among the lunting fraternity. Why, down to Cobb's Island, about three years ago, there came a party of five, and they were so parsimonious that they would not patronize the bar, but lought their whiskey by the bottle, and actually slept five in a bad.

And now, having explained myself (I hope to the satisfaction of everybody), as Captain Cuttle would observe, "I had my say, and what I say I stands to."

#### , THE EAGLE AND OTHER LAKES OF MAINE,

THE EAGLE AND OTHER LAKES OF MAINE.

The your issue of Aug. 12th, A. F. J., New York, asks for information, "in regard to trout fishing in the Eagle and neighboring lakes," how to get there, etc., etc. Having made the trip myself, I shall take pleasure in answering him by letter, if he will address me. I wrote up the trip fully for the Rod and Gux, and now have it in my scrap book, but I omitted to retain the date of its publication, so I cannot refer him to the number it appeared in. It was entitled, "Mooschead Lake, Penoboscot River and Beyond." The trip was made in June, 1876, and appeared shortly after in the Rod And Gux, The trip is a very pleasant one, and easy to accomplish. It is about forty-two miles from the north end of the carry from Mooschead Lake. The carry itself is two miles long from the upper end of Mooschead. Said carry can be reached by steamer from Greenville or Kineo, and teams can be had there to take your canoes over to West Branch; here you will find "Joe" Morris ready to entertain you over night, and you can start down river early in the morning. You can easily reach

#### ROCKY RIFTS

about fifteen miles, in time for dinner. Here you will encounter turbulent water for some twenty or thirty rods—dangerous, unless your guide knows his "biz?" otherwise, safe and exciting to run. Four of our party "did it," and found it delightful. Six miles further, and West Branch spreads out into Chesuncook Lake, where you find a small settlement, and where you can get entertainment. You next turn your face northward, and run up stream up the Umbazooksous River, some seven miles, into the Umbazooksous River, some seven miles, into the Umbazooksous Lake, crossing the south end of the same. You strike, after a mile's paddle,

#### MUD POND CARRY.

MUD POND GARKY,
the worst carry in all Maine, about two miles in length.
Everything must be "toted" here, so you had best go
light through mud, which is generally to be found on
this carry. Half a mile across Mud Pond takes you to
the outlet, and a mile and a half then leads you into
Chamberlin Lake, a body of water some fifteen miles in
length, by three in width. Crossing this take, diagonally (some four miles), takes you to Chamberlin Farm,
where sportsmen are always welcome. Three miles
northerly, following the eastern shore, and you reach
"The Locks," which, passing through, takes you through
a connecting fiord, some two miles, into Eagle Lake.
From Eagle Lake a very pleasant trip may be made
through the Allegash into the St. John River, and thence
down to Woodstock (viu Grand Falls) or St. John, N. B.
This trip has been often taken by sportsmen. From
Morris' it may be easily done in ten days, or even eight,
with smart guides. We made our trip from Moosshead
to Eagle Lake, and return to Mooschead, in five days,
without fretting, spending one day at Eagle Lake. But
you have to keep moving to do it, and guides don't much
like it, and will likely tell you "it can't be dud."
Regarding the fishing, you will have no trouble in the
lishing season in catching all the trout you need to eat,
but you will not find them as plenty as at Mooschead
and its tributaries, nor as large. Good guides, however
familiar with the waters, will find trout always in the
season.
The best guide I know of to take the trip with is Capt.

season.

The best guide I know of to take the trip with is Capt.
Samuel Cole, Greenville, Maine, which, by the way, is a
good place to start from, and where other good guides

may be obtained. At Kineo House, also, you will generally find plenty of guides, if you write in advance to the proprietor of the Kineo House, Greenville, Maine. Bo sure, however, you get at least one guide who is familiar with the route, and that all your guides are expert river guides, otherwise you may find your cance bottom up, as canceing in quick water is quite a different affair from canceing in a lake. Good river guides will charge you from \$3 to \$3.50 per day, cance included. One guide to two men is amply sufficient, if you go light; otherwise, one to each man.

From Morris' down the West Branch, several pleasant trips may be taken. From Chesuncook, a pleasant and

From Morris' down the West Branch, several pleasant trips may be taken. From Chesuncook, a pleasant and very exciting trip may be made to Old Town, Maine, via river all the way (save carries). A book, "Summer Vacations at Moosehead Lake and Vicinity," by Lucius Hubbard, will give you valuable information, has a fine map, and is richly illustrated with heliotype plates; published by A. Williams & Co., Boston, price §1.50. Another excellent book, with same map, "Guide to Moosehead Lake and Northern Maine," published by Bradford & Anthony, Boston, will afford you much useful information; price, 75 cents, 1 think, I would recommend all sportsmen going in that direction to purchase both, The Forest and Stream Publishing Company will send them to you upon receipt of price. (Eco. A, FAY. GEO. A. FAY. them to you upon receipt of price.
West Meriden, Conn., Ang. 14th.

PAWTUCKET, R. I., Ang., 20th.

Seeing no allusion to the inclosed in your issue of 19th inst., allow me to call attention to errors in your answers. Answers should be, viz.: Troating good all through that country. The lakes you mention are very easy of access. All of the larger lakes can be reached with only one carry, viz. Mad Pond Carry; that is leaving out Northeast Carry at head of Moosehead, where with only one carry, viz.: Mud Pond Carry; that is leaving out Northeast Carry at head of Moosehead, where canoes and baggage are carried across in wagons. Dozens make the trip every year—over thirty to my knowledge made it last year in August and September. Plenty of guides and all kinds of supplies can be obtained at the Kineo House, Moosehead Lake. Excuse my corrections of your answers—should have written last week had I been at home. I have been through the country inquired about, several times; once with my wife and two children—a boy of nine, and gird of seven—on my way down the St. John's. I was there last year on my way from St. John to the Aroostook waters, and am going same route this year, taking with me one of your occasional correspondents and a brother-in-law, T. S. Steele. I cannot imagine who the party of three you mention could be. I intended camping on Eagle Lake last year, but the camp fires were so thick I lett for the Aroostook waters. I was so delighted with the trip, and have talked so much of it to Steele, that has signified a desire to go with me this year. We start about Sept. 15th, and I presume on his return he will give you an account of it. I should have done so last year had I been that kind of a man.

Lyxan B, Gorg.

### CAMP CREAM O'TARTAR,

No Man's Land, August, 1880.

No Man's Land, August, 1880, woods this season, save ours, hendded us departure by many promises of prowess in hunting and fishing, and many promises of fish; and a squad which went down east by water actually and deliberately took a historian along to chronicle its adventures. We slipped off quietly—so quietly that I'll wager a hamper of tront against a basket of wine that no one knows who we are, So, to save curious readers brain-work in the dog days, I will unravel our personal identities. Our party is a trio—the "Doctor," the "Major" and the "Sernbe." So now you know us. Much good it may do you! Much good the camping out has done us! We have caught everything catchable in this region except a cold, and we daily "wax fat" and "sick" up our heels in very wantonness of enjoyment in living. The Doctor has a small finsect net, with which he is occasionally, or rather frequently, seen running frantically about in pursuit of a strange insect. Some country gentlemen who saw him so engaged went away strongly impressed with the idea that he had the deliruin treuness slightly. Yesterday he was chasing what he solemniy avers was a double-headed hure a head at each end—and his food. with the idea that he had the delirium tremens slightly. Yesterday he was classing what he solemnity avers was a double-headed bug—a head at each end—and his foot catching a root he took a header into the lake. Being a good swimmer he came ashore as soon as he came to the surface. The Major can't swim a stroke. The other morning he had our day's supply of egans in his hat, and when stepping from one boat to the other he stepped deliberately between them into the lake. Down Le went, and coming up again among a ratt of "weeds" he sputtered, "Save the ergars," and sank once more, We saved every eigar, and the man, and dried them. The Major wishes every day, many times a day, for

he sputtered, "Save the eigars," and sank once more, We saved every eigar, and the man, and dried them. The Major wishes every day, many times a day, for his sword. Not that he has any tears for his personal safety, but it would be so handly to spear frogs with. The Doctor has just made an important scientific discovery. He has found out that grasshoppers in this section are subject to the hip complaint in whortleberry time. He is now writing an article, in very small chaft, on the cover of a cracker-box, to the London Luncel amouncing this fact. He expects to pay all his camping-out expenses by the renumeration he will receive for the communication, but it's my opinion that he will be out of pocket the express charges on the cracker-box cover. If you, dear Forest, expect to receive with this screed any lish you are mistaken—very much so. What we can't eat we sell, and don't send a scale to our bosom friends. We have a ready marker, and the more fish we dispose of the less our emping-out costs us, which is an outrageously sellish, but an entirely common sense, view to take of it. The Doctor does not derive \$13,000 per annum from his practice; the Major was refased by his grateful country a pension for knocking off his left great toe while fighting, or fleeing, or something in the Wilderness, so he isn't rolling in wealth, and as for me, who ever heard of an 'ink-slinger' with any flithy lucre? But oh, Forest, if you will but come and sen us (you can't stay too long) you shall eat of the best, drink of the choicest, and read the Doctor's cracker-box cover essay. Will you come?

The SCREE.

#### PACKARD'S ZOOLOGY.

R. PACKARD'S work is one of real value both to Within the student and the teacher of zeölogy, the past few years several so-called Manuals of Zoology have appeared, but, though some of them were not with out a certain value, there was no one of them all which was not open to severe criticism. It is pleasant, there-

fore, to be able to speak of the present work as one of the very best of its kind that has yet come under our notice. It is not, of course, wholly free from mistakes; but such a book never can be perfect, and the few errors which are noticeable are, for the most part, of minor importance, and will no doubt be corrected in the subsequent editions, which will unquestionably be called for.

The work is admirably adapted for use as a text-book, and perhaps and-a fact which will especially reommend it to the beginner-is little burdened with those technical terms. which proved for so long a time a stumbling-block to one who attempts, without previous training or the assistance of more advanced workers. to gain a general knowledge of the structure of the principal types of animal life.

The treatment of the subject in hand is very good, the definitions and descriptions of structures clear though brief, and the language employed is such as can be comprehended by the general reader. This indeed constitutes, to our mind, one of the principal axcellences of the book, for it is

certainly an unusual state of things to find a work-espec ally one which treats of invertebrates-in which half a dozen consecutive lines will convey any intelligent impression to the mind of the non-scientific reader.

We are unable to give, at any length, the plan of the present work. The author commences with the simplest and most elementary forms, and proceeds from these through the higher groups, ending with the vertebrates, a method which seems to us much better than working down the scale from the higher groups to the lower.

The first eight chapters are devoted to defining the great groups of the animal kingdom; Chapter IX to the Comparative Anatomy of Organs; Chapter X to Development. The five succeeding chapters, which conclude the work, treat, somewhat briefly, the Geographical Distribution of Animals. the Geological Succession of Animals, the Origin of Species, Protective Resemblance, and Instinct and Reason in Animals. These, containing as they do summaries of many of the latest views on these most interesting topics, demand perusal by all who are fond of the study of nature. The volume is made still more useful to the student, or the reader who may desire further information with regard to any special group than can be given within the limits of a general work like the one under discussion, by a bibliography, in which the principal works necessary to the student of zoology are enumerated. There is also a glossary defining the more important technical terms employed,

The volume is well printed and very fully illustrated by wood-cuts, some of them original, but mostly taken from other works on zoölogy.

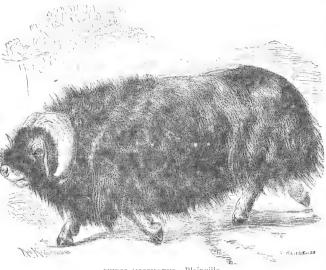

Taken as a whole the work is one

student or the general reader, and it is indeed indispensable to any one who is interested in any form of animal life.

To the courtesy of the publishers, Messrs, Henry Holt & Co., we owe the opportunity of reproducing the accompanying wood-cuts of two American forms figured in the zoology. They will be interesting to our readers, not only in themselves, but also for comparison with certain extraordinary illustrations which recently appeared in the columns of a contemporary purporting to be reproductions of the figures of the Rocky Mountain sheep and the musk ox given in Dr. Packard's work.

#### THE CAPTIVE WOODCOCK

M. MORRIS' tame woodcock, Dick, continues to excite great interest among sportsmen, and his owner's cosy little flower and bird store is daily visited by numbers of the fraternity, who take great delight in watching the bird. His new quarters are much more commodious than the old, and his owner has removed him to the greenhouse, where the noise of the street and the persistent attentions of the small boy, who always takes such delight in poking up the animals, no longer disturb him. The increased room and the quiet seem to have a beneficial effect upon Dick, and it appears that he is gaining in weight and generally improving in health.

OVIBOS MOSCHATUS-Blainville

It is very interesting to watch the bird feed, and to see him, after he has satisfied his hunger, plunge his bill several times into the sand, and then, walking to the Mr. Morris, having received a lot of the bright red worms one. His master thinks that the worms tasted of the

water-dish, wash it by gently shaking his head. Dick is somewhat fastidious about his food, for some time ago found in stable yards, offered them to the bird, and though at first he seized them he declined to eat a single ammonia of the stable yard, and this idea is confirmed

OVIS MONTANA-Cuv.

which we can very cordially recommend, either to the | by the fact that these same worms, after having been kept for a few days in fresh earth, were devoured with as much apparent relish as the common worms.

The voracity of the woodcock is proverbial, but opportunities for exact observations on this point rarely occur, and it seemed important in this case to take advantage of Dick's captivity to arrive at some definite results as to the amount of food devoured by him in one day. therefore requested Mr. Morris to make certain observations; and in his very clear letter, given below, there is food for much reflection. It appears from these experiments that the woodcock, even in captivity and deprived of the exercise which a wild bird takes, devours daily

more than his own weight of worms. This statement will excite the wonder of every one, but when we consider the total number of worms devoured by a bird in a year, or by a number of birds in any given time, we are at a loss whether to be more astounded at the voracity of the bird or the multitude of the worms which must exist to feed them.

Mr. Morris' letter is as follows :-

ist to feed them.

Mr. Morris' letter is as follows:

JEFFERSON MARKET, New York, Ang, 18th.
In answer to your favor of the 10th inst., I beg to hand you the following particulars about my woodcock, Dick, who is doing well.

From noon Aug. 12th to noon Aug. 13th the bird ate five and a quarter ounces (Troy), or 200 worms. He weighs five ounces (Troy). The worms were given to him a couple of dozen at a time. I have fitted up a place for him with two breeding cages for canaries. In one is moss and a dish with clayey mud, in which I put the worms. I scatter worms in the moss, and he amuses himself, while not gorging himself with the worms in the moss. He does this for pastime, as he frequently fishes out a worm and allows it to crawl back into the moss without attempting to eat it. In the other cage are moss and a bed of bright, sharp, coarse sand, with a poin of water sunk in the moss. He appears to like to trot about in the sand, and bores into it, but when his bill becomes covered with sand he goes to the water and washes it. I have not seen him drink. His digestion appears to be perfect. I shall get some peaty mud to put his worms in, as I have an idea that the mud he bores in now contains sandy earth, which injures his bill, as this organ appears dull, as if worn by silica in the earth, and not polished, as seen in woodcock in a state of nature. Many sportsmen visit my store to see Dick. I am, very truly yours.

Account request Mr. Morents. visit my store to very truly yours, JOHN MORRIS.

At our request Mr. Morris has repeated his experiment with Dick, and the result shows that the recent changes of quarter has had a very beneficial effect. Mr. Morris says,

writing under date of Aug. 23d :-

Writing under date of Aug. 2001:—
I made the experiment, as you requested, and found that the woodcock consumed eight ounces of worms in twenty-four hours, and could have eaten more had I given them to him. The bird now weighs six ounces, having increased in weight one ounce since I obtained possession of him.

JOHN MORRIS.

FOOD OF SNAKES.—Frederick City, Md., Aug. 7th.— Editor Forest and Stream:—I noticed in Forest and Stream that Mr. C. R. Shaw killed at Sayville, L. I., a black snake, and on shaking the reptile by the tail a striped

C. R. Shaw killed at Sayville, L. I., and shaking the reptile by the tail as triped snake nineteen inches long came from its mouth, and it was still alive. I write to state that this is of no uncommon occurrence. I have killed plenty of black snakes with striped, or what we call in Maryland garter snakes, in their stomachs, and I have afterwards 'held up black snakes, just after being killed, and have seen striped snakes come out of their mouth and fall on the ground and run as well as ever. On one occasion in the Singanore Hills, I killed a large black snake six feet long, up a tree. He had in his stomach one pine, or red squirrel, one striped snake three feet long, and nineteen eggs the size of pigeons' eggs. When I was in the act of skinning the black snake, the striped snake came out of his mouth and seemed to be'as lively as ever. seemed to be as lively as ever.
FRANK SCHLEY.

Notes on Snakes,—Burke County, Ga.—Editor Forest and Stream:—Being aware of the fact that all accounts of the wonderful pertaining to snakes, regardless of the integrity of the writer, are taken cum grano salis, I will simply state what I saw yesterday. In waking on the road I discovered what looked like two snakes in very close proximity. Upon a closer examination I found a king snake swallowing a ratlesnake—the former three and a half feet in length, about, but apparently considerably smaller than the latter, which was the possessor of five rattles and a button. I knew that the "king," called "chicken snake," would eat chickens, would attempt an undertaking so apparently impossible. It was slow work, and I looked on until was so thoroughly disgnsted I shot them both, leaving them for the dirtiest scavenger—the buzzard not excepted—the hog, which in a short time devoured both with a reish no doubt. Whether this is anything uncommon I know not, but it astonished me, and will, no doubt, be a surprise to some of your readers.

D. P. D.

.....

We regret extremely that our correspondent did not see the play out, and, further, that he did not give us more particular details of the manner in which the king went to work to devour his prey. Will he not give us such particulars now?

Editor Forest and Stream:—I notice that the snake is coming to the front, and perhaps the following true tale may be appropriate to the snaik column: A few years since I was engaged in clearing a scrub-oak lot, and one day while I was resting I heard in the brush just in front of me a snapping of twigs; on looking to discover the cause, I found a black snake, some three feet in length, in the act of swallowing a striped snake; they were both twined around the twigs, the striped one holding on for dear life, but the black was too much for him, and had engorged more than one-half of his victim when I first found them. I watched them till I saw the tip of the striped snake's tail disappear down the black's mouth, when, with a quick stroke of my bush-scythe, I cut the reptile in two, when, to my surprise, out ran the striped snake, apparently unharmed, and made his escape.

Pembina, D. T., Aug., 11th.—Editor Forest and Stream:—In a recent issue of Forest and Stream, a correspondent gives some items upon the capacity of the correspondent gives some tens upon the capacity of the ophidan gullet, to which I will add my experience. When a boy of twelve, I once killed a large striped snake. He bulged out so strangely, that I cut him open and found a huge toad nearly as broad as my hand, and still able to kick feebly. Whether or not the snake believed in jewels in the toad's head, he evidently considered the support of the snake the strength of the snake the species valuable for dietetic purposes, and from the shape of the reptile of sedentary habits, it might with propriety be called a "square meal." M. A. BROWN.

Pleasant Plains, Aug. 13th.—Editor Forest and Stream:—Noticing your article in paper of Aug. 5th, on the cannibalistic snake, I would say I killed one Tuesday. Aug. 10th, under similar circumstances. While our after the cannibalistic snake, I would say I killed one Tuesday, Aug. 10th, under similar circumstances. While out after woodcock I came upon a black snake over four feet long in the act of swallowing at large garter snake. He had him half way down, and evidently, intended making a clean job of it. He lay motionless until I-struck him with a stone, and then ejected the garter snake, which was nearly used up, the neck just back of the head being lacerated. The black snake then raised his head toward me in a threatening manner, making no effort to escape. I could detect no hissing. It would seem from this that snake will eat snake, and that the victim is seized by the head.

CAPT, CLAYTON. seized by the head. CAPT, CLAYTON.

An exchange contains the following item with regard to an enormous rattlesnake recently received at the Smithsonian Institution, which is interesting. It is as followed

The largest rattlesnake probably, that has ever been seen in Washington, arrived at the Smithsonian Institution on Saturday from Florida, forwarded by Mr. James Bell, who is in that State on special duty from the Interior Department. The snake belongs to the Crotalus adamanteus, or diamond rattle family. It is about eight adamantens, or diamond rattle family. It is about eight feet long, will measure twelve inches around the body and has twelve rattles and a button on the end of its tail. It came in a close-woven canvas bag, and was at once dropped into a large square wooden box, with wire work sides and a sliding cover, prepared for the reception of venomous reptiles. Not having been fed for some time it is particularly ferocious, and its rattle is constantly on the sliake whenever any one approaches or there is any noise in the room where it is kept. This monster snake is to be killed in a day or two, for the purpose of taking a plaster cast of it. The manner of killing for this purpose is by putting the serpent in a close vessel and admitting a sponge saturated with chloroform. This preserves the form so that a life-like cast may be taken.

ALBINOES, NO DOURT.—A correspondent from Wawa-yanda writes to us about some cream colored rats with pink eyes which are multiplying about his buildings, and asks if they are albinoes. He describes them as abun-dant and more bold than common rats, and states that mant and more bout than common rats, and states that they do much damage, gnawing everything within reach. We think there is no doubt that they are albinoes, for white rats and mice usually, or often, produce albi-

Foo of Squirrels.— Wavayanda, Ang. 14th.—
Editor Forest and Stream:—Living in a locality where
squirrels are quite numerous, I have noticed they do not
subsist entirely on nuts and acorns, as a great many people suppose they do. A number of the little ground
squirrels have taken up their abode in the ice house only
a few steps away from the dwelling house, and almost
any time these little fellows can be seen scampering
around the yard. A short time since, in company with
some frienes, we were watching one of them playing
around, when all of a sudden be jumped in the air and
caught a barge black besetle, and then quietly sat down
on his haunches and pulled off the bug's head and eat it,
and then finished the body with an evident relish. Again
I noticed the same little animal picking blackberries off
a bush and eating them, seemingly enjoying them very
much. My brother, driving along the road one day, saw
a red squirrel descending a ree from a robin's mest with
one of the eggs in its mouth, and scamper off in the
woods with it.

Wallkill.

Red squirrels are great robbers of birds' nests.

Red squirrels are great robbers of birds' nests.

Pembina, D. T., Aug. 11th—Editor Forest and Stream:
—In your last number I see a communication which I recognize as coming from an old friend, in regard to the economical habits of the gray squirrel, and would like to add my continuation. In the fall of 1876, while strolling through an orchard in Ohio, I saw a squirrel run into a pile of rails with a large nut in his mouta. Prompted by curiosity I overturned the pile and found no less than three pecks of butternuts snugly piled in a cavity. The store was tempting, but admiration for the industry of the little "varmint" prevailed over cupidity, and I replaced the rails and left it undisturbed.

#### NEW YORK FISH COMMISSION.

To the Public:—
The Governor of this State declined to give his sanction to the usual appropriation for the maintainance of artificial fish culture, the means whereby the public waters of the State have been stocked with the choicest game and food fish to an extent that has created plenty where before there was scarcity. This unlooked for action, the reason for which has not been communicated to the Commissioners of Fisheries, leaves a valuable public property in waters, buildings, hatching apphanoes and stock of fish without the means of available use or even of preservation. The stock fish, many thousand in number, requiring daily care and feeding and capable of producing annually 5,000,000 of fry, are the fruit of many years' careful selection and breeding, and if lost now cannot be replaced without years of labor and many thousands of dollars expenditure. The State hatchery of Catedonia, acquired at a cost of \$15,000, is, in respect to its supply in quantity and quality of water, its equipment in the most approved appliances for breeding, its skilled and experienced operators, its supply of stock fish, and in the success which has attended all its operations, the most complete and valuable of its kind on the west side of the Atlantic Ocean. What has been done by the commission toward replenishing exhausted waters with the finest game and food fish is too well known to the public. The multiplication of shad in the Hudson River to the extent of many million each year, so that the cost to consumers has been leavers. The Governor of this State declined to give his sanc-

game and foof fish is too well known to the public. The multiplication of shad in the Hudelon River to the extent of many million each year, so that the cost to consumers has been largely reduced within the last ten years, alone justifies all the appropriations that have been made by the State for the promotion of artificial fish culture. The commissioners cannot consistently with the duty committed to them by the Legistature permit this valuable property and the important interest involved in its use to go to decay and destruction by reason of the refusal of the Executive to sanction the appropriations necessary for its support. They therefore announce to the public that the operations of the State hatchery will, if need be, and as fur as shall be necessary to save the State from loss, be continued under the personal responsibility of the members of the commission, after the close of the fiscal year and until the Legislature shall have an opportunity to review the action of the Governor, in the hope that the enlightened sense of the members of the law appropriations at the earliest possible stage of the session; or, failing to do this, will provide by law for such a disposition of the property as will save the sacrifice which may result from a failure to provide the requisite current support.

\*\*RICHARD\*\* U. SHERMAN.\*\*

\*\*ECHENE\*\* G. BLACKFORD.\*\*

\*\*These are good words and bravely spoken.\*\* The com-

These are good words and bravely spoken. The commissioners stand in the gap and will not allow the results of the work which has been done in past years to go to waste. Many men would throw up the whole affair in disgust at the false economy which saves at the spigot and wastes at the bung, but the New York Commission is made of better stuff. They know that the people of the State are with them, and are aware that their work is for the general good, but it is well for the people at large to know that these men who give their time to this matter and occasionally receive abuse from short-sighted people, serve without the slightest pecuniary recompense, seeking their reward solely in the consciousness of having done good deeds, and in the knowledge that their work is appreciated by all who have paid the slightest attention to political economy. It is needless at this late day to enter into any explanation of the character of their work or its benefits.

The local press throughout the State is commenting on the loss that is entailed by the Governor's veto, and the great New York dailies also come out strong upon it. After speaking of the good work of the commission the Herald says :-

Unfortunately the State Executive, amid his manifold duties, has not had his attention directed to these facts, and in a spirit of economy, which would be highly laudable were it more intelligent, he has refused to sanction the annual appropriation for artificial fish culture. The natural effect of this veto would be the immediate ruin of a valuable and flourishing establishment which could not be replaced for years. From such a misfortune, however, the State will be temporarily saved by the public spirited and patriotic conduct of the commissioners—Messrs. Roosevelt, Sherman and Blackford—in continuing the operations of the State batchery upon their personal responsibility until the next Legislature can review the action of the Governor. There cannot, of course, be any doubt of the action of that body. Unfortunately the State Executive, amid his manifold

In this connection it may be proper to say that a private citizen has offered to give five hundred dollars for the use of the commission, if needed, and it is to be hoped that his example will be followed. Surely the money will be well invested for the future benefit of the people.

GOOD CROP OF SALMON EGGS PROMISED,-United A Good Crop of Samon Eggs Prodused—United States Fishery, Buria, Shasta County, Cal. Aug. 12th.—We went into camp this year the last week in June, since which time we have all been quite busy with the usual work of making preparations for taking the salmon eggs. Our intentions are to take six million of eggs this year, a considerably smaller amount than were protured last season. Three million of these are to be distributed in the East, and two million are for the State of California, leaving a margin of a million. Of those for this State, one million will be hatched here at the fishery, and the young salmon will be placed in the McCloud 4 close time should be arranged progressively. A series of

River. The other million will be carried to Pit River, hatched there, and the young fish deposited in that river. Hitherto, high falls have prevented the salmon from ascending to the head waters of this stream for the purpose of spawning, but the last State Legislature appropriated three thousand dollars to remove this obstruction, and this will open three hundred miles of spawning ground which was previously useless. At present everything is in readmess for the spawning season. The bridge of racks is in place to prevent the salmon going up the river, the hatching houses, etc., are in order. This has been accomplished in a very thorough manner under the genial and efficient supervision of Mr. Livingston Stone, with the assistance of his practical and reliable foreman, Mr. J. A. Richardson.

There is an unusually large run of salmon this year, and it would be a yery easy matter to take several million

There is an unusually large run or samon this year, and it would be a very easy matter to take several million of eggs were it required. Several parties from San Francisco and other parts of the State have recruited themselves in this vicinity with the pure waters and air of the McCloud and the sport of hunting and fishing. They the McCloud and the sport of numing and issuing. They evidently enjoyed themselves, as they were reluctant to leave, and promised a like "outing" next year. The month of September will be a busy one for us, a large force of white men and Indians will be employed, and we have every reason to expect a prosperous season.

GEO. B. WILLIAMS, JR.

#### SHAD HATCHING AND SHAD LAWS.

Editor Forest and Stream:—

I notice, in your issue of Aug. 5th, in the article upon the work of the Connecticut Fish Commission, an account of their failure in the attempt to hatch shad at and near the mouth of the Connecticut River. It would seem that the attempt was made by the desire of the committee on fisheries of the last Legislature, and against the better judgment of Dr. Hudson, one of the commissioners. It seems to me that a committee of men of sufficient judgment to be intrusted with the duties of legislators would not, in the management of their private business, attempt such an undertaking without informing themselves as to its feasibility. They would naturally seek the advice of fish culturists. Any intelligent authority would be likely to say that anadromous fishes would not probably ripen their spawn and milt, to an extent that would insure fertilization, while remaining in salt water. The intelligent and natural conclusion would be that the fish would not be in a condition for fertilization before reaching their natural spawning ground. Repeated experiments by intelligent and experienced fish culturists show that a large percentage of the fishes are unripe upon their arrival at their natural spawning grounds. The student of nature would argue that the fishes would naturally reach their spawning grounds in time to select and prepare their beds before the arrival of the time for performing the final functions of nature.

The foregoing expresses my individual opinion as en-

of nature. The foregoing expresses my individual opinion as entertained for several years past. A few years ago, so intelligent a trio as the New Jersey State Fish Commission were supposed to be, made the attempt to hatch shad in the Delaware River at Pennsgrove, N. J. a considerable distance from the mouth of the river, but more than a hundred miles below their natural spawning grounds. I at once predicted a total failure of the undertaking. For quietiy expressing my opinion upon this and some other absurdities of the commission, I incurred their active hostility, but my predictions proyed true peyertheless. at once predicted a total failure of the undertaking. For quiety expressing my opinion upon this and some other absurdities of the commission. I incurred their active hostility, but my predictions proved true nevertheless. Not a shad was hatched, but the State had to pay for the foolish experiment. My opinion upon this subject was quite substantially fortified while making some investigations at South Hadley Falls a few weeks ago. It is well known that one of the earliest successful attempts to hatch shad artificially was at that point. That quite successful and best advertised fish culturist, Mr. Self Green, was employed, I believe, by both national at State authority to make the experiment. After exhausting his fund of experience and other knowledge in connection with the experiment and the make a failure in the attempt, and packed his boxes, intending to return home next day. In the meantine an old shad fisherman, well known at the falls, besought Mr. Green to let him make a trial. The boxes were unpacked and the fisher man placed them in a tributary of the river, composed of spring water, and the experiment was an unnediate success. I believe Mr. Green received the credit. The locally accepted reasons for Mr. Green's failure and it offsherman's success were, that Mr. Green's required was made in the warm water of the river, which was very low at the time, while the fisherman's experiment was made in the cooler water of the tributary. With these reasons the matter rested. I have taken the fibery of pursuing the subject a little farther, and trust your readers will pardon any scenning egotism in my statement of conclusions: First, it is well known at the falls that no shad ever pass over the expensive lishway erceded at Holyoke Dam. The result is that the shao are stopped long before reaching their natural spawning grounds, and are, consequently, not in a condition for certain fertilization upon their arrival at the Falls. This fact would have operated against Mr. Green's attempt. The fisherman, anking his at

intelligent observations could be made at the commencement of the shad season, upon which could be based with practicable accuracy a scale of close time for different points on any given river. My own opinion is that no shad should be taken with sense until they make their appearance upon their spawning grounds; then let the work commence at the same time upon the whole length of the stream. Under the prevailing laws, the fisheries at or near the mouth of the rivers have several days advantage over the upper fisheries, which is certainly unjust.

legislators and other officials would, in their official "It legislators and other officials would, in their official capacity, exercise the same degree of judgment that they do in the munagement of their private business, our laws would be more just and official duties more intelligently performed.

M. P. P.

### FRIGATE MACKEREL AGAIN HEARD FROM.

NEWPORT, R. I., Aug. 12th.

Editor Forest and Stream:—
The past week has brought many new observations regarding the abundance of the frigate mackerel (Auras et al.) recently referred to in FOREST AND STREAM as having for the first time appeared on our coast. These fish seem to have come in immense schools into the waters between Montauk Point and Georges Bank, and from Mr. Clarke's statements it appears that they have been observed in sent Il uniques by fishermen in pravious verys.

ish seem to have come in immense schools into the waters between Montank Point and Georges Bank, and from Mr. Clarke's statements it appears that they have been observed in small numbers by fishermen in previous years. Several vessels have come into Newport recently, reporting their presence in immense numbers in the vicinity of Block Island. It will interest the vicinity polapsists' to know that several persons in Newport have tested the fish, and pronounce it inferior to the bonito. Part of the fish, that on the posterior part of the body, is white, but behind the gills it is black and rank, while the meat near the backbone is said to be of disagreeable, sour flavor. It is hard to predict what its influence will be upon other fishes already occupying our waters. Its mouth is said and its teeth feeble, so that it is hardly likely to become a ravager, like the bonito and the bluefish. There is little probability, on the other hand, that its advent will be of any special importance from an economical point of view, for its oil does not seem to be very abundant, and it would hardly pay at present to capture it solely for the purpose of using its fiesh in the manufacture of fertilizers.

Mr. A. Howard Clarke, in charge of the fish commission station at Gloucester, has communicated to Prof. B did some interesting facts regarding its abundance. From these statements it would also appear that the species has been observed occasionally in past years. He writes under date of Aug. 10th; "I have received this morning, from the schooner Fitz J. Babson, just arrived from Block Island, a fish answering to your description of the Anais, having a corselet of scales around the pectoral fin as in the tumy. The captain of the vessel, Joshua Riggs, reports that about a week ago he had a hundred barrels in the seine at one time, and saw over twenty schools of them. He saw them as far East as Sowand-Pig Light Ship. They are very easy to caten, flip like menhaden, do not rush, and are not frightened at the seine. They go in immense

of water. He took it to Boston, where it was called a young bonito.

"Mr. John Henderson, of the schooner Sarah C. Wharf, says that two vessels caught such fish recently castward of here. The schooner American Eagle, of Province-town, took a number of barrels of them into Newport, and sold them for a dollar a barrel. Another Cape Cod vessel—he does not know her name—took about fifty barrels of them and threw them away. All the mackerel seiners from Block Island report seeing quantities of this secretic within the ways fortigith. The canain of the rels of them and consequences of them and consequences from Block Island report seeing quantums of new fish within the past fortnight. The captain of schooner Sarah C. Wharf says he first saw them a night ago some fifteen sailes off Block Island. The tain and several of the crew of the Ella M. Johnson Newburyport, just arrived from Block Island, state saw alundance of the Auzis, but did not know who will be supported to the consequence of the consequences of the The can Johnson

Newburyport, just arrived from Block Island, state they saw alumdance of the Amais, but did not know what it was until reports came from you at Newport. They opened one and found in its stomach the ordinary red mackerel food. This crew differ with the crew of the schooler Fitz J. Babson with regard to the case of capturing them—think them rather difficult to take; say they flip like progies, and do not rush like mackerel; they saw ten large schools of them on Saturday last when same fifteen miles south of Block Island.

I hope that any reader of Fourser ANN STREAM who has seen this fish will mention it. Some may, perhaps, have an opportunity of studying its habits. The length of those I have seen ranges from twelve to sixteen inches, and their weight from three-quarters of a pound to a pound and a half or more. Those sent to New York market were part of the lot taken by the schooner American Eagle and brought into Newport, whence they were shipped by Mr. Thompson, a lish dealer of this place. It would require from eighty to one hundred of them to fill a barrel, so the estimate of Captain Riggs that there are a thousand barrels in one of the schools, shows how exceedingly abundant they must be. The name "frigate mackerel," used in Bernuda, would seem to be the best name for use in this country, since the fish resembles the mackerel more than they do the bonito or tunny.

CARP IN TENNESSEE.—Nushville, Tenn., Aug. 6th.—
Messrs Newman and Gardener returned from a month's fishing in the upper Stone River. They report having had excellent sport, taking a great many bass and black perch. On a trot line they captured a monster catfish; he weighed forty-sis pounds. It is specially noticeable that in all the streams in this State greater quantities, more varieties and iner fish have been taken this year than for many past. Col. Akers, our fish commissioner, received last year from Prof. Baird a quantity of German

carp. Mr. Frank Green obtained forty of these little strangers, to place in a pond on his farm near the city. He reports them having grown to five or six inches in length, and says that he has noticed an enormous number He reports them having a religious them has noticed an enormous number of small minnows in the pond lately. Can they be the product of the carp so recently placed there? At what age do they begin to spawn? Mr. Green says that there were a few mud-cat in the pond when the carp were put in it. Although they have not interfered with the carp. Could it be that the minnows referred to, were of that species. It would be a matter of interest to have an answer from the Forest and Stream to these questions.

J. D. II.

There have been many reports of the spawning of carr which were distributed last year, and it is possible that yours may have done so. It is also possible that the young fish referred to are carp. It does not seem possible that they could be confounded with "mud eels." Send specimens to Prof. S. F. Baird, Washington, D. C., and then you will get positive information.

GROWTH OF BLACK BASS IN CALIFORNIA -The following letter seems to indicate that the black bass grow rapidly in their new home in the West :-

SAN FRANCISCO, Aug. 4th.

Mr. Seth Green:—
Your letter making inquiry concerning the black bass which we received from you in the spring of 18.8, is before me.

They were placed in a small lake, containing about 100 acres, back of Oakland, and last week we went there for the first time with our rols to see if we could catch any of them, as we were uncertain as to what had become of them, and were anxious to learn, the result of our expe were placed in a small lake, containing about 100 them, and were anxious to learn the result of our experiment. To our surprise and delight no sooner had the cast been made, than one was hooked, and whenever we threw in anywhere around the lake we met with a similar response. About twenty were caught in ashort time, measuring from eight to ten inches in length, no doubt of last year's spawning. Upon examination we saw a great many small ones, from three to four inches in length, in schools of several hundred. These schools of small black bass were to be seen all around the lake, and we are satisfied that the water of the lake is adapted to them. The lake will be well stocked in a year or two, and we will then have rare sport; until then no fishing will be allowed.

Conroy, Dissert and Figure 2 tisement, last week, for their own, thereby giving a suppossion of the reel advertised. If those interested will refer to the advertisement this week they will find a correct representation of this famous black bass reel, which is an improvement on the Frankfort reel, and manufactured only by Messrs. Conroy, Bissett & Malleson, and not by Messrs. Abbey and Imbrie, as might be inferred by last week's advertisement.

Salmo Wilmoti Again.—Grand Falls, N. B., Aug. 10th—Editor Forest and Stream:—I must certainly take exception to some remarks over the signature of "Win. Couper," which appeared in Forest and Stream, and also to the editorial comments at foot. The Ontario salmon, exhibited last fall at Ottawa, are without doubt a distinct variety, and not the true Salmo salar, the ovar and fry being of a lighter and more delicate color than those of the salar, as every one who has been engaged in the artificial reproduction of fish of these classes is aware. The distinctive title conferred on the Ontario sulmon, and which is with such singular bad taste objected to by your correspondent, originated with the Acclimatization Society of France, at the time of their presentation to Mr. Wilmot of a gold medal in rec taste objected to by your correspondent, originated with the Acclimatization Society of France, at the time of their presentation to Mr. Wilmot of a gold medal in recognition of his sevices in the interests of fish breeding. It has never yet been determined if these fish migrate to the sea, many reflecting persons being of opinion that they frequent salt springs within Lake Ontario. This point, however, it is hoped will be shortly cleared up, as it is expected that facilities for close observation of the habits of these fish will be afforded by the government.

Our remarks, which were appended to the letter of our correspondent, Mr. Couper, to which our other correspondent, B., objects, were simply these: "There is no fish known to naturalists by this name, neither has there been any description of a new salmon from that region published lately. The salmon found on Lake Ontario and its tributaries are Salmo salar." These we repeat, with the addition that our correspondent evidently thinks the color of eggs and fry sufficient to found a species No names are accepted by zoölogists without a description, and no such description has been made by any one competent to do it; or, if so, it has not been published in America. The land-locked salmon of Maine, the so-called S. gloverii, or S. sebago, is now declared by

our best authorities to be S. salar, as no structural differences can be observed. It is now in order for our correspondent to give us the name of the ichthyologist of the Société d' Acclimatation who christened this salmon, together with his reasons for creating a new species differing from the salar.

It then rests with the zoologists of America to accept or decline it, according as the reasons may seem valid or otherwise. At present it is safe to say that S. wilmoti is unknown to them, and, until we receive the name from one of the prominent ichthyologists of America, we must decline to allow it to be a valid cognomen. now hope that our correspondent, B., will see that we are upon solid ground, and that we are ready to accept the dictates of science, when we know that it is science which dictates.

The Ichthyophagists.—The New York Times remarks upon the recent dimer of this society that it may be useful in introducing to our tables some valuable lishes which foolish prejudice has hitherto neglected. The skates, for instance, which live principally upon crustacens and mollusks, the very food which gives to the sheepshead and pompano their delicate flavor, and make the whitefish of the great lakes so delicious. Most European nations have long ago recognized the excellence of the skate.

ne skate. This writer, however, is mistaken in supposing that the This writer, however, is mistaken in supposing that the razor-shell clam was first eaten in the United States at that dinner. This species of clam has long been used by the people of the east coast of Florida, who value it highly, and it is there taken with a long hook of wire, just as the writer in the Times descibes the capture on the coast of France. Lhave often caten this clam at the Halifax River Inlet. Stewed with tomatoes it makes a most rich and savory dish. The razor-shell is called "Langeroni" by the Minorcans of St. Augustine. It has the tenderness and delicacy of the oyster, with a flavor all its own. It comes in season in May, when the oyster is going out. There are other shell-fish eaten on that coast, particularly a very small clam, about an inch long, with a particulorly a very small clam, about an inch long, with a particulorly a very small clam, about an inch long, with a particulorly a very small clam, about an inch long, with a particulorly a very small clam, about an inch long, with a particulorly a very small clam, about an inch long, and survey soup. and savory soup.

The present writer has tasted many species of fish,

and savory soup.

The present writer has tasted many species of fish, from shark to sculpin, and the only one that he has found to be wholly uneatable is the dogfish of the Western and Southern waters (amia calten), sometimes called "lawyer." Nothing but starvation could induce a man to eat hearthly of this soft, cottony, vile-flavored fish, Even the hogs reject it. It is only fit for the manure heap, except that from its belly can be cut a silvery strip which is very tough and suitable for pickerel bait.

When the writer in the Times classes the maskalonge with the catfish and sucker, he induces the belief that he has never tasted Esox nobilior—certainly, next to the whitefish, the most excellent of the fishes of the Northwest. It is, however, rare, and the Great Northern pickerel is often sold for it. Of the three best fishes in the United States, two are peculiar to America—the whitefish of the great lakes (Coregonus alins), the pompano of the Florida coasts and the gulf (Trachynotus carolinus), and the sea-salmon of the Northeastern coast (Salmosidar). Of these the salmon is the richest and the whitefish the most delicate; for the same reason it bears transportation the best. The pompano combines the excellence of the two former, and may perhaps be considered the best fish on this continent.

But to enjoy any of these in full perfection they must be eaten on the shores of their mative waters—even the salmon, which best bears transportation, gives one, when cooked and eaten in camp, just from the stream, a new idea of what a salmon may and should be. S. C. C.

\*BLACK BASS IN IOWA.—Manchester, Iowa, Aug. 7th.
—The bass season opened June 1st, and a great portion of the time since the waters have been muddy, and the fishing has not been good or regular; but on some occasions the catches have been large. Four gentlemen with two boats on the Learest mill-Idam, at the headwaters of the Maquoketa River, in this county, caught sixty black bass in three hours in the afternoon and a few hours in the morning. This string averaged about three pounds—one weighed six, and many of them three, four and five. These bass will not be taken with a fly, and I would like to see some of the fancy bass fishers catch one with an eight ounce rod. They could not catch a two-pounder with such a rod. The instant they take the minnow they dart for the roots of an old stump, the only

would like to see some of the fancy bass isher's catch one with an eight onnce rod. They could not catch a two-pounder with such a rod. The instant they take the minnow they dart for the roots of an old stump, the only place the large ones are found, and in an instant they lake the minnow they dart for the roots of an old stump, the only place the large ones are found, and in an instant they have wrapped your line three times around a root ten feet under water. The most expert fishers do not let the cork go down more than a few incles until a quick jerk with a stiff pole stops him.

The six or eight mill-ponds of the Maquoketa in Delaine County are absolutely full of yearling and two-year-old bass. The enforcement of the closed season has caused this great success in breeding them. Shaw's fishway will soon be placed in the dams, and this will greatly aid us. We have two varieties of black bass—one the pure black bass. You will know him from his balyhood to did age. He is black, fine scaled and almost always has atmasparent. We can see the fry by the millions now, three inches long, and they will jump for a minnow. The other variety is greenish in color, with beautiful black or brown spots almost like a trout, only the spots are larger. Two persons fishing from the same boat will catch them alternately, one black and one green. There is no certainty of how they became inhabitants of our waters. As yet there has been none caught as large as the black bass. Some say they were placed in the Wapsey Run from Otsego Lake, and came from the Missispipi River here.

We have some of the finest trout streams in the world, towhich I have before called attention. We have millions of young fry.

Never were there so many quall in Iowa—the roads and fields are full of them. The prairie-chicken season opens on the 16th. They have not been so fine and plenty for years; but it is impossible to prevent some persons from

killing them now. Their hungry gullet outrides all their fine feelings, and, although they claim to be gentlemen, they are pot-hunters.

they are pot-hunters.

BASS FISHING IN KINDERHHOOK LAKE.— Mr. L. H. Abbey, of Abbey & Imbrie, went up to Kinderhook Lake, last Friday, after his old friends, the black bass. They gave him a most delightful reception, and more than forty insisted on going home with him to dimer. One old chap, who weighed four pounds and two ounces, found great difficulty in giving due expression to his feelings; being so completely overcome that he was unable to say a single word, but merely danced on his tail and jumped some two or three feet out of water more than a dozen times.

Air. Abbey was most hospitably entertained by Robert Trimper, proprietor of the Lake House. There was only one thing which married his pleasure, and that was a thing which the fish wardens ought to put a stop to at once. He discovered a number of set lines and was credibly informed that almost every night nets are dragged in the lake. This will soon put an end to good fishing in this beautiful and conveniently located augling resort. Those who knew Abbey and his opinion of anyone who will use anything but a fly for taking tlack bass, can understand his feelings on this subject.

Gerstand his feelings on this subject.

Salmon and their Migration.—Montreal, Ang. 10th. I have just returned from an extended trip through the maritime provinces, and can report good success trout fishing, but poor sport among the salmon. The latter have been so scarce that most of the fishermen on the Bry Chaleur took up their nets fully three weeks ago. The few salmon that they caught were marked and mutilated by porpoises, which, together with sharks, are swarning in numbers in all the bays along the north shore. Since Prof. Hind's letter appeared in your columns I have taken considerable pains to get the opinions of many of the north shore fishermen regarding some of the theories advanced by him, that salmon are biennial spawners and often enter the rivers for sanitary purposes, not for the purpose of spawning. Most of the fishermen regard these theories as mere suppositional ones, without any positive show of proof to back them, while there are abundant proofs that some salmon ascend the rivers with remarkable uniformity to deposit their spawn. My own opinion is that the diseased fish, let loose from the ponds at the hatching establishment, very materially assist the porpoises and sharks in driving Salmo sodar from their accustomed baunts. Let us hear from some of our intelligent and observing fish commissioners on this subject.

The Use of the Hook on the Salmon's Jaw, —Prof.

STANSTEAD.

The Use of the hook on the Salmon's Jaw, — Prof. Hind's view of the purpose of the hook on the lower jaw of the male salmon, and his statement of the practical use to which it is put by the fish in aid of the, operation of spawning, as expressed in Foirest Any Stream July 22d, are certainly very interesting and very novel. I am at a loss, however, to know whether these views are presented as the results of actual observation, or as hypotheses. I should say, judging from the manner in which the subject is introduced by Prof. Hind. He does not assert the presence of a "hymen" in the organs of the female salmon, but says: "I think you will find," etc. If, then, the whole description is hypothetical, it must await positive proof. If there exists any positive evidence in its favor maturalists will surely be under great obligations to Prof. Hindi the will give them, through Forrest and Stream, a detailed statement of the observations from which his conclusions have been drawn.

\*\*Rudswort Union\*\* [March 101]\*\* nwn, Bucksport, Maine, Aug. 10th. CHAS. G. ATKINS

Salmon Migration on the Pacific Coast.—The Olympian says: "The taking of salmon in the sea off Monterey has banished two theories which had previously been accepted by the pisciculturists of this State. First, it proved that the Sacramento River salmon, when migrating to the sea, went south instead of north of this port, and this, in turn, may account for the ability of this variety of salmon to traverse the warm water of the lower Sacramento on their way to the spawning grounds. Second, an examination of the stomachs of these fish showed, in every instance, their food to be tomocade or frost fish (a bottom fish), instead of herrings, smelts, anchovies and other small surface fish. That the salmon which frequent the tributaries of the Sacramento River to spawn during the summer season come from the sea south of this port is also corroborated by the testimony of Capt. Hobron, who has run schooners between San Francisco and Santa Cruz during the past eighteen years. Capt. Hobron states that he has frequently seen salmon at sea breaching into the air between this port and Santa Cruz, and has attempted to take them, but without success, not having suitable bait."

UNTERSH EAT SNAKES.—Sawanna, Tenn., Ang. 9th—It is too hate for this snake story to enter in competition for the "big hook," but as it is true I will send it on. A few days ago a party of gentlemen were bass fishing on a stream a few miles from town. One of them was fishing in a canoe, and seeing a snake lying on a log in the middle of the stream killed it with a blow of his paddle, mearly severing its head from the body. The snake fell into the water and sank out of sight. About an hour after one of the party hooked, and after a long and exciting struggle landed a blue or channel catifish weighing afteen pounds. On cleaning this fish the snake was found inside of if, and was recognized as the same snake from the fact of its head being nearly severed from its body. The snake was of the striped water snake variety and measured over thirty-one inches in length. Will.

MENHADEN PLENTY, BUT WEAK.—Tuckerton, N. J., July 19th.—Prof. Spencer F. Buird, Wushington, D. C. Dsar Sir: I take the liberty to inform you of a singular fact in regard to the menhaden in this vicinity. The menhaden this season, up till within the past week, seem to have been plenty, covering the water for miles each way from this place, not in schools, but scattered all over, so that the dishermen could not catch many. There also have been plenty of the largest kind of bluefish here all the season. Some of the schools of them, my fisher-

men think, would cover an acre of ground, and, instead men think, would cover an acre of ground, and, instead of leaving, seem to stay. This past week there seems to be one or two large strenks of blood in the water; one of them, my men think, was one and a half miltes in length and five or six miles off shore. The menhaden also seem weak; as soon as the net goes around them, and they are fast, they sink right down in the net, dead, so that it is almost an impossibility to raise them. Some of my men think it is the bluefish not giving them time to feed; others lay it to the heat making them so weak. Please advise me if the above communication is of any service to you. If so, I will report any other peculiarity I may notice. Will you also, if convenient, advise me what you may think is the cause of the weakness? Respectfully, JAMES E. OTIS

fully,

FISH IN MARKET,—There is a falling off in the number of bluefish from the East coast but many are coming from New Jersey. The first smelt of the season have arrived from New Brunswick. Large Spanish mackerel, averaging four pounds, are arriving from New Jersey. Si eepshead are more plentful from Barnegat. Soft craos from Long Island are also plenty. The first scallops of the season were received this week from East Greenwich, R. I. Prices: Salt water fish: stripped base, 25 cents per pound; smelts, 25; salmon, 35; mackerel, 15; weakfish, 10; Spanish mackerel, 25; haldlock, 6; kingfish, 25; codfish, 10; blackfish, 12; flounders, 8 to 10; porgies, 12; sea bass, 18; cels, 18; sheepshead, 25; smoked salmon, 20; green turtle, 15; lobsters, 10; soft crabs, 81 per dozon; scallops, 49 per quart. Fresh water fish: whitefish, 15; salmon trout, 15; frogs, 35 cents per pound.

### FLY-FISHING FOR BLACK BASS.

Fifth Paper.

THE MECHANICS OF FLY-CASTING.

I T has been deemed advisable, for the purpose of making plainer the modus operandi of casting the articual hy, to introduce the following cuts and diagrams. As stated in my last (fourth) paper, the backward movement, or throw, is made in one time and one motion; while the forward movement, or cast, is made in one time and two motions, according to the following formatic of time. ula of time :-

$$1. = 2. (\underline{a}) \circ (\underline{b}) \circ.$$

No. I represents the backward throw, in one motion, in the time of a half note. No. 2 represents the forward cast, in one time and two motions, a and b, in the time of two quarter notes. This is not to be understood as fishing by note, but the relative time of making the different motions in casting the fly approaches very near that of the formula given. This is better explained by a reference to the following cuts; where figure 1 represents the backward throw, and figure 2 represents the first part or motion (a), and figure 3 the second part or motion (b), of the forward cast. The following diagram represents the arcs described by the tip of the rod, and the flies:—

 $\bigcirc$  is supposed to be the angler, and as we are looking down upon him, from above, it represents his hat. The dark line, a b e, is the curve described by the tip of the rod in the backward and forward movements of the cast:

rod in the backward and forward movements of the cast: back over the left shoulder, and forward over the right: while the dotted curved line,  $d \in f$ , is the approximate are described by the tail  $R_f$ , leaving the water at d, and alighting, by a lengthened cast, at f. By studying these diagrams in connection with the instructions heretofore given, the theory and mechanical principle will soon be mastered by the novice. He should then by assiluous and patient endeaver make a practical application of these principles, and become tolerably proficient in casting the  $R_f$ , before he attempts to venture near the haunts of the bass.

#### GENERAL INSTRUCTIONS AND REMARKS

GENERAL INSTRUCTIONS AND REMARKS.

It has been doubted by some that the black bass will rise to the fly, or at best that they are uncertain in their modes and times of doing so, as compared with the brook trout. These doubts are mostly raised by those who angle for the black bass in precisely the same way as for the brook trout, upon the supposition that the two fish are identical in habits and instincts. But while their habits of feeding are very similar—both feeding on the bottom, in midwater, or on the surface, on crustacea, larva, minnows, insects, etc.—they differ greatly in other habitual features and idioxyncrasies.

The black bass will rise to the fly as readily, under any and all conditions, as readily, under any and all conditions, as the brook trout, when fished for understandingly, and under proper precautions. There are times, seemingly favorable, when neither bass nor trout will rise to the fly.

One reason why the bass is thought to be assertion.

favorable, when neither bass nor trout will rise to the fly.

One reason why the bass is thought to be uncertain in rising to the fly is this: While he is fully as wary as the trout he is not so tind). A trout darts meontimently away at the first glimpse of the angler, and is seen no more; but the bass will retire but a short distance, and as often will stand his ground, and on balanced fins will watch the angler vainly casting his brown hackle or coachman over him, perhaps haughing in his sleeve (shoulder girdle) at his disconditure. The truth of the matter is, the bass is not uncertain, but he is too knowing to be deceived by his flies, so long as the angler is in sight.

ing to be deceived by ms mes, so long as the anger is in sight.

Fish are more suspicious regarding objects on the surface of the water than of those beneath. I have often demonstrated this, causing them to skurry away, by holding a long stick immediately over them, above the

surface; while I could introduce the same stick under-neath the water and even prod the fish with it, without alarming it much. This is why more caution is necess-ary in lly-fishing than in bait-fishing; the lait in one in-stance being on the surface, and in the other, beneath. If a black bass, in rushing to the surface for the fly, sees the angler, he at once stops in his course, and thenceforth the daintiest flies, never so deffy thrown, will be cast in vain while the angler remains in view.

The most important rule, then, to be observed, first,

be observed, first,

vain while the angler remains. The most important rule, the last and all the time in fly-fishing, is: Keep out of sight of the fish; and the next is: Keep as quiet and motionless as possible. Let your necessary as quet and methoness as pos-sible. Let your necessary movements be deliberate and methodical, avoiding all quick, sudden or energetic motions. Fish see and bear much better Fish see and hear much better than we give them credit for. To keep out of the fish's sight we must be screened by such natural objects as bushes, trees, rocks, etc., or by keeping well back from the brink and mak-ing love and the first and mak-

back from the brink and making long casts. In wading the stream it is also necessary to make long casts. The latter is the best plan of fishing a stream, as the angler, being so near the water, is not so ant to be seen.

It is useless to cast for black bass from high elevations

near the water, is not so apt to be seen.

It is useless to cast for black bass from high elevations near the water, as an bold bank, a projecting rock, a dam, etc., under ordinary circumstances; for the angler must remember that the most commanding situration for seeing the fish also furnishes the best facilities for being seen in return, and vice versa. In fishing from a boat, it must be kept in deep water, while long casts are made in shore, toward the feeding grounds. We should never tish with the sun at our back, or in such a position as to throw the shadow of our rod or person upon the water. From what has been said, it will be apparent that it is absolutely necessary that there be a breeze sufficient to ruffle the surface of the water. It is perfect folly for the angler to cast his flies upon a smooth surface, if the water is clear enough for fishing. A gale is better than no wind at all/and it does not matter from what direction the wind blows, if the condition and temperature of water are right. A good breeze is the angler's best ally, for by rippling the water it breaks the line of sight, to a great extent, between him and the fish.

The angler should endeavor to cast his flies as lightly, as possible, causing them to settle as quietly as thistledown, and without a splash. After casting, the flies should be skipped along the surface in slightly curving lines, or by zigzag movements, occasionally allowing them to become submerged for several inches near likely-looking sposts. If the current is swift, allow the flies to float naturally with it, at times, when they can be skittered back again, or withdrawn for a new cast. Two or three times are enough to cast over any one spot, when a rise is not induced.

When bass are biting eagerly and quickly, whipping the stream is

When bass are biting eagerly and quickly, whipping the

When ba stream is to be prac-ticed, that is, the easts are to be often and rapid-ly repeat-ed, first to one side, ne side, then the other, al-

then the other, all. Living the flies to set the but a moment. In casting and manipulating the flies to set the but a moment. In casting and manipulating the flies, the line must be ever taut: for often a bass will thus hook himself, which he never does with a slack line. The angler should strike by sight, or by touch: that is he should strike the moment he sees the rise; for the bass has either got the fly in his mouth, has missed it, or has already ejected it, when the rise is seen; it very seldom happens that the rise is seen before the fly is reached by the fish. The angler must also strike at the moment he feels the slightest touch or tug from the fish, for often the bass takes the fly without any break at the surface, especially if the flies are beneath the surface. Striking is simply a twist of the wrist, or half turn of the rod, either upward or downward unward with stiff-ish rods, and downward with very willowy onest, which is sufficient to set the hook if the rod and line maintaina proper state of tension; but when the careless angler has a slack line, and, consequently, a lifeless rod, he must necessarily strike by a long upward or side sweep of the rod, called "yanking;" and should he succeed in hooking the fish, the chances are that it will shake the hook out again before the slack can be recled up.

The rod must always be held upward, so that it constantly maintains a curve with the line; and never urder any circumstances must the rod point in the direction of the flies after they reach the water, forthis allows the direct strain of the fish to come upon the line or leader. When a basis is hooked, he must he killed on the rod; the rod must stand the brun; of the contest; timmore pliable and springry the rod, the less likelethood of its breaking, for a stiff rod is more pliable than a fleation of the rod with the sweet of the rod, and do not header. When a basis is hooked, he must he killed on the rod; the rod must stand the brun, of the less likelethood of its breaking, for a stiff rod is more pli

It is best, always, to fish down stream, even with the wind against one, for obvious reasons. Cast just below ripples and rapids, over eddies and pools, along the edges of weed patches, under projecting banks and shelving rocks, near submerged trees or driftwood, off gravelly shoals, isolated rocks and long points or spurs of land; it is useless to fish long, deep, still reaches of water.

The most favorable time for fly-fishing for black bass is during the last hours of the day, from sundown until dark, and also on bright moonlight evenings. On streams, an hour or two following sunrise, in warm weather, is quite favorable. On dark, cloudy and cold days the middle hours are best. Bright sunny days, especially in bot weather, are not favorable to fly-fishing, except in quite cool, shady and breezy situations. In short, the best conditions are a nellow or dusky light, a good breeze, and translucent water; while the most unfavorable are a bright sun, a still atmosphere, and a smooth and glassy surface, with the water either very fine or very turbid. And now, in concluding these papers, let me say a parting word to the beginner: Cast a straight line; keep it taut; strike upon sight, or tonch; kill your fish on the rod; take your time. It is better to cast a short line well, than a long one bunglingly. Should you cast your fly into the branch of a tree overhead, or into a bush behind you, or miss your fish in striking, or lose him when booked, or crack off your tail-fly, or slip into a hole upto your armpits, keep your temper; above all things don't swear, for he that swears will catch no fish. Remember, yours is the gentle art, and a fly-fisher should be a gentleman.

Cynthiana, Ky., Aug. 6th.

BIETH OF A SEA-LION.—A sea-lion is announced as having been born in the circus of W. C. Coup, now in Virginia, and the bills say: "This Polar midget is at once the theme and unqualified delight of all beholders. The little folks are especially delighted with this occanic infant, to larger than a kitten and the only one on exhibition on the earth's surface," etc. We cannot do justice to the big letters, and the rest of the phrascology is incomplete without them, but if Coup says he's got it, we helieve it.

Post the Gam: Laws on Railroads.—New York, Arg. 16th.—Editor Forest and Stream:—As partridge shooting begins on the 1st of September, and as the trappers and snavers of said birds begin their notorious work on that same day, would it not be well for our different game associations to try to prevent them, and thereby stop the wholesale shughter of the finest bird we have. Some years ago the supervisors of Orange and Reckland counties passed a law making it a misdemeanor for an express company or a railroad to carry or transport trapped or snaved birds. I therefore would suggest the following: Let the different game associations get up printed copies of the laws against trapping and snaring; let said notices be put up in the baggage car of each train running on the Eric Railroad between Jersey City and Port Jervis, also on the Hudson River between New York and Albany, and also not the different railroads of Long Island; let, also, said notices be put up in each station along the above-named railroads. Permission will be easily gotten from the railroad authorities, and the expense of said notices would not be very large. The Long Island Railroad could be attended to by the Long Island Game Protective Association, the Eric Railroad could be looked after by the Hudson River Game Association, and the New York Gentral Railroad and the markets where those trapped birds are sold. I, for one, an willing to pay my share toward the expense of all this, and, without any doubt, a good many sportsmen will do the same. Let us move in this matter at once, and thereby we will have thousands of birds, quail as well as partridge.

A TRUE LOVER OF THE SPORT.

WANTED, MORE LIKE HIM .- The following commu nication is addressed to the editor of the Tarrytown, N. Y. Argus, and published in that paper with an editorial indorsement of the writer's faithfulness and energy :-

dorsement of the writer's faithfulness and energy:—
In your last issue appeared an article signed "Philo Minor," in which he speaks of woodcook shooting and the violation of the game law. While I agree with him on his remarks on shooting birds before the law is up, (which I think no true sportsman will do). I think he speaks rather too harshly about game constables. While there are some who need to be reminded of their duty, there are others who do all that lies in their power to enforce the laws; and one of the latter class I claim to be, because I feel interested in the protection of game birds and have for a number of years, from time to time, had the game laws published in the Argus. After I was elected to the office of game constable I did all I could to enforce the laws, and I am wilning to attend to all complaints that are made to me; and the fact that I had several hundred copies of the game laws printed, which have been distributed through the town of Mount Pleasant and some in Greenburgh, in order that people might know the laws, will show that I mean business.

I claim to take as much interest in the protection of game, and am willing to do as much work toward the same, as any true sportsman can, not excepting "Philo Minor." GEO. LAICK,
Game Constable, Town of Mount Pleasant.

VIRGINIA QUAIL SHOOTING. -Editor Forest and Stream: VIRGINIA QUALD-SHOCTING.—Editor Forest and Stream:—Please inform me where a party of two can go in Virginia to get first-class quail shooting this fall, not over a day's ride by railroad from Washington, D. C.? Would not object to going to a farmer's where they are pleasant and where birds are plenty. Don't want to go where people object to gunning. Will want to remain about two weeks, if the shooting is good, and want to go where we can have a good, free and easy time. F. & B.

A Washington correspondent kindly furnishes the information desired as follows :-

Tornation desired as follows:—
Last fall there was first-class quail shooting on the Rappahannock bottoms near tide water. King George Court House is a good place of rendezvous, and from there one can move off in almost any direction and obtain good shooting. A general State law "posts" all lands in the State, but gentlemen can almost invariably obtain the particular of courties. The state of the court of of

State, but gentlemen can almost invariably obtain the privilege of shooting by proffering a polite request.

There is also good shooting to be had in Accomac County, Quail will be very plentiful in Maryland and Virginia next fall owing to the mild winter and the weather of the spring, which was favorable to the broods. Last fall was so hot and dry that dogs had considerable difficulty in working, and the quail were not slaughtered by the wholesale, as usual. By the way, I see that the Sun last week copied my article on "Sportsmen in Congress" from the Forest and Stream.

AN ANCIENT FLINT-LOCK .- A Vernon, Ind., correspondent sends us a clipping which describes a curious relic of the olden times :-

of the olden times:—
Robert Levitt. of Vernon, has deposited in the State
Museum the remains of an ancient flint-lock breechloading gun which was found several feet below the bed
of the creek near Vernon. It was first exhibited at the
old settlers' meeting, but none of the pioneers remember ever having heard of a breech-loading, flint-lock gun.
The barrel, rusted through in several places, is three feet
long, with a large bore. The spring is still strong, but
the stock, of black walnut, is badly decayed and only a
small piece of wood could be secured. The only theory
advanced to account for its presence in the creek was
that an Indian trail from Lawrenceburg was frequently
used by soldiers of 1812, and as the creek was on the line
of this trail, the gun was lost or thrown aside, only to be of this trail, the gun was lost or thrown aside, only to be brought to light in this day of breech-loaders. Gatling guns and heavy ordnance.

guns and heavy ordnance.

Georgia Dove Shooting.—Macon. Ga., Ang. 16th.—

I notice a communication from J. D. H., Nashville, Tenn.,
on "Dove Shooting." Some of our Macon sportsmen
have had fine sport recently in that line, several parties
killing as high as 600 birds in one day's shooting. Five
of us killed 252 one day, and four others the next day
bagged respectively 60, 94, 102 and 105. This calls to
mind a day's hunt in an adjoining county in 1868, in
which 1,200 doves were bagged. Muzzle-loaders were
used, and two brothers bagged respectively 113 and 123,
shooting six hours.

shooting six hours.

New Hampshie—Like Village, Aug. 16th.—Wood-cock hunting is good in this place, Meredith and Belmont. Large bags are brought in every few days. Myself and friend shot thirteen over the same dog after 4 P.M. Friday of last week. A party went to Centre Harbor one day last week, and brought home eighteen that were very fat and in splendid condition. Grouse in this locality are very plenty, and promise a good season's soort.

Git.

MEADOW LARK SHOOTING.—The answer to a correspondent in our last week's issue, was inadvertently given without a reference to the June, 1890, amendments to the New York game law. The season for meadow lark shooting is from Oct. 1st to Jan. 1st, and does not begin, as was dated, Sept. 1st.

NEW York—Hornellsville, Aug. 16th.—Not over a dozen woodcock have been killed here so far this season. A few miles from here three men got twenty-one in one day, which is the best bag I have heard of the large in 
-Three Wilson snipe were killed on the Newark mea-—Three Wilson snipe were killed on the Newark mea-dows last week. Although these are early birds, yet it is not unusual for English snipe to be shot in that vicin-ity early in August. We remember once of hearing of thirteen birds being shot on the Elizabethtown meadows in July. No doubt the birds had bred there.

-We have received the constitution and by-laws of the Kirtland Shooting Club, of Cleveland, Ohio.

#### SHOOTING MATCHES.

MASSACHUSETTS STATE GLASS BALL ASSOCIA-TION.

THIS association, is the result of the Lynn Sportsman's ber of shooters considered that the lifth of June last, when a number of shooters considered that the interests of glass bull shooting would be better met through the power and influence of combiwould be better met through the power and influence of combi-nation. Success has attended every footstep, and when it is men-tioned that the constitution and by-laws have been printed and all the preliminaries goue through which rendered this last shoot so successful, it will be admitted that little time has been lost to put in practice the desires of the 17th of June meeting. The as-sociation baving no neutral ground where the short could be scenarion naving no neutral ground where the shoot cound of belad, determined to accept the invitation of the Lynn Central Club to hold it upon their grounds at the Ocean House, Revere Beach, where all the conveniences could be had for a shoot of this kind, the Ocean House, Boston, and Lynn being in hourly communication and close proximity to each other. The Committee of Artion and close proximity to each other. The Committee of Arrangements, to carry out all preliminaries, consisted of three from the association and three from the Lynn Central Club. The good tecling and harmony which characterized these gratiemen, coupled with the efforts of the Secretary, Mr. F. H. Lander, of the Oak Island Club, centralited largely to this meeting going off in such good style; it consisted as follows: for the Association, D. Kirkwood, President; F. T. Noble; E. W. Webster, Treasurer; for the Lynn Central, I. C. Haskell, O. L. Baldwin and

R. E. Hilliard. The appended scores give the full result of the

The first contest was the individual association gold badge shoot; open 10 members of the association; entrance fee, \$1. Forty per cent. to go with the budge as first prize; 30 per cent. second prize; 23 per cent. third prize; 10 per cent. fourth prize; 15 bulls per man; Card rotary trap. There were 50 men tied at 15, not missing a ball. When the ties were shot off, the prizes were awarded to go to the prize were awarded. C. Spofford, ladge to J. H. Frost, of Lynn, who got 44 straight; C. Spofford, A. P. Ston, of Worcester, and 6t, Monk, of Quincy, divided third and fourth money. The individual score was as follows;—

as follows: Badge to J. H. Prost, of Lynn, who world straight:

C. Spollord, of Amesbury, rook second prize, and C. H. Wales, of
Amesbury, A. P. Pond, of Worcester, and G. Monk, of Quincy, divided third and fourth money. The individual score was as followed.

WASHINGTON GUN CLUE.—Hroship Driving Park. L. I., Aug.,
20th.—Regular monthly competition for the champion gold badge,
at 7 birds, 21 yards rise. The birds were a fine lot. and required
the best skill of the marksmen to bring them to the ground. The
contest was exciting and the shooting was the best exhibition
ever shown by the club. Six out of thirteen killed their birds in
succession, viz. Dierking, Rittenhouse, Hedeman, Evans, Killett,
and Altenbrand. These gentlemen shot off the tile at 5 birds
each, and Mr. Altenbrand won the badge.

Falcon Gun Club.—Parks Park. Jameies L. L. Jameie.

Falcon Guy Club.,—Dexter Park, Junaica, L. L., Ang. 19th: Kelly, 21 yards, 5; Lemoken, 23 yards, 9; Vagts, 23 yards, 6; Vat Staaden, 23 yards, 7; Miller, 25 yards, 6; Offerman, 21 yards, 7; Main, 25 yards, 6; Loger, 21 yards, 6; Mayer, 8; Mayer, 9; Mayer, Lager. N. Y. State Association rules and Falcon Gun Club handi-cap riso. Prizes, gold club badge and Westly-Richards breech-loader, which when won three successive times becomes the property of the shooter.

FIGURE SHOOTING CLUB. - Clereland, Ohio, Ang. 17th, - Score of the monthly shoot of the Kirtland Club for gold badge, Card rotary trap, screened, 15 birds:-

#### NATIONAL AMERICAN KENNEL CLUB.

THE committee of this organization, at a recent meeting, decided that the club field trial Derby should be run at Vincennes, Ind., on or about Nov. 15th. The following gentlemen were selected, and have consented to act as judges: Mr. Theo. Morford, of Newton, N. J., and Captain Patrick Henry, of Graddy's Landing, Ark, These trials, beyond question, will outshine in every respect anything of the kind ever witnessed in this country. Subjoined will be found the rules and instructions to judges of the club. The latter we do not think are as clear as they might be, particularly the instructions on backing and quartering. In the brace stakes the maximum for ranging and maximum for quartering are raised from 6 to 10 points each, making the total 108, instead of 110, as published officially:—

AMERICAN KENNEL CLUB. NEW YORK, Aug. 16th, 1880.

RULES FOR FIELD TRIALS.

Rule 1.—Managers of field trials shall advertise the time and place where the meeting will be held, the date of closing entries, the scale of points and the names of judges at least thirty days before the trials take place. In the event any judge or judges fail to act, the competi-tors shall fill all vacancies, each competitor being entitled

In the event any judge or judges fail to act, the competitors shall fill all vacancies, each competitor being entitled to one vote.

Rule 2.—Dogs shall be drawn in braces by lot and run in heats, the beaten dogs to be retired (except as hereinafter provided), and the winners to be run again in the order in which they won their successive heats. If there should be a bye, the dog getting the benefit of the bye shall be run in the first heat of the next series of heats. If two dogs owned or exhibited by the same person should be drawn to run together or come together in any successive heat, the second dog shall change place with the next dog in the order of running. This shall be continued until only two dogs remain, and the winner of these two shall be winner of first prize. The last dog beaten by the winner of first prize shall compete for second prize with the best of those dogs previously beaten by the winner of first prize. The winner of this heat shall be declared winner of second prize winner, and those previously beaten by the second prize winner, and those previously beaten by the second prize winner, and those previously beaten by the second prize winner, and this given the judges of deciding which is the best of those beaten in this heat shall compete with the best of those previously beaten by the second prize winner, and third places by selection or by running extra heats between them.

Rule 3.—When two dogs owned or trained by the same

given the judges of declaing which is the best of these beaten dogs in the competition for second and third places by selection or by running extra heats between them.

Rule 3.—When two dogs owned or trained by the same person shall be drawn together, one shall run only in that heat, and he with the next dog in the order of running not so owned, unless at the latter end of the trial it be found impossible to avoid running two such dogs together, when it may be permitted. A withdrawal from any heat is a withdrawal from the race. If in drawing there be a bye, and a dog be withdrawn in this heat, the dog with the bye and the other dog in the heat withdrawn from shall be compelled to run against each other, as if so drawn.

Rule 4.—The judges shall order up the dogs as soon as they have determined which is the best according to the scale of points in Rule 5. The privilege is granted the judges of ordering up any dog or brace of dogs that have not sufficient merit, in their opinion, to get placed; but these may be put down again if there is a possible chance for them to win.

Rule 5.—Positive points for merit: Pointing, 35: pace. 20; backing, 7; style, 6; stanchness, 6: ranging, 6: quartering, 6: obedience and disposition, 4; retrieving, 10.

Total, 100. Negative points for demerit: False pointing, 1 to 7; breaking in (cacho offense), 3: breaking shot (each offense), 5: chasing or breaking shot and chasing (each offense), 10.

Rule 6.—No person except the judges, attendants and reporters will be permitted to accompany the handlers of the dogs. Two persons will not be permitted to work one dog or a brace of dogs is disabled to such extent that he cannot shoot, the judges shall appoint a person to shoot for him. The handlers of the two dogs shall shall be appointed to enforce this law. No person shall make any remark about the judges or dogs in hearing of the judges. Such persons offending shall be expelled from the grounds. Should any handler of dogs annoy the judges after having been ordered to desist, the judges sh

Rule 7.—Pointing fur, feather or reptiles shall not be considered making a false point. A dog making a point and discovering it to be such without any er agement from his handler shall not be penalized.

#### INSTRUCTIONS TO JUDGES.

INSTRUCTIONS TO JUDGES.

Pointing—The judges will allow only those dogs the maximum that point all the birds possible for them to point under existing circumstances: a dog to carn the maximum number of points under this head must display a first-class nose and exhibit great judgment in finding and pointing his birds, and make no flushes that a dog with the above qualities would avoid in ordinary hunting. The dogs are to be hunted in all respects as in an ordinary day's shooting. Inexcusable or willful flushes will detract from a dog's score under this head, but the character of the flush must be always taken into account in estimating the penalty, if any. The judges must not ask the handlers if their dogs are pointing, but must decide for themselves. They shall always consider the nature of the ground, the wind and the birds, and not penalize a dog for flushing a bird it would be impossible to point. The penalty for flushes to be graded by the character of the offense. The judges shall not require the handlers to work their dogs down wind. Judges are allowed the discretion of declaring a dog or dogs out of the heat if absent when called.

Pace—The dog that maintains the fastest gait throughout the trial, except when in cover or on game, to receive the full number of points, all others to be graded by him.

Backing—The maximum only allowed such dogs as

him. Backing—The maximum only allowed such dogs as stand or drop only at sight of another dog pointing. But no dog shall be expected to back unless the dog pointing stands and is motionless. A dog shall not be said to refuse to back unless he sees the dog pointing. To get credit for a back the dog must stop at least ten yards (when practicable) in front of the handler.

Style—The judges shall consider the dog's grace in ranging and drawing, and attitudes in pointing and backing.

ing.
Stanchuess—The maximum allowed such dogs only as

do not advance from their point when they are on game

do not advance from their point when they are on game until ordered on.

Ranging—The maximum only allowed the dogs that maintain the most killing range throughout, viz., wide or close, as the necessity of the case may require.

Quartering—The maximum only allowed such dogs as work at right angles with the handler, unless the nature of the ground renders such work impracticable.

Obedience and Disposition—The maximum only allowed to a dog that works promptly to the gun, without noise or severity, and is obedient, prompt, cheerful and easily handled.

Retrieving—To receive the maximum under this bead.

noise of severity, and is obscient. Promps, cheering and easily handled.
Retrieving—To receive the maximum under this head a dog shall go promptly and cheerfully for the bird and deliver it to the handler without monthing or mutilation. False Pointing—The judge shall give a dog ample opportunity to discover whether or not he is on a true point, and the penalty shall range from one to seven for his acts throughout the heat.

Breaking In—Is when a dog through imperfect breaking or from excitement leaves his position when the birds rise, whether the gun is fired or not, and starts to break shot or chase, but stops within a few feet of the point from which he started, of his own accord, or by command. mand.

from which he started, of his own accord, or by command.

Breaking Shot Is when a dog runs in when a shot is fired with the intention of getting the bird, and does not stop promptly at command.

Chasing Is when a dog follows the birds, either when the gun is fired or not, to an extent to be beyond the control of the handler for the time being.

PUPPY STAKES. Rule - Dogs over eighteen months old shall not be eligible for the Puppy Stakes. There will be no points allowed for retrieving in this stake. Rules otherwise as above.

BRACE STAKES. The rules governing the Brace Stakes shall be the same as those used in the All-Aged Stakes, with the following exceptions: The maximum for rugartering shall be ten instead of six, and the total 110 instead 100. The brace to earn the maximum for quartering must cross each other systematically, and work independently of each other, or one dog must quarter the ground on one side of the handler while the otherdog quarters the opposite side, the dogs meeting at or near the center. Each brace will be run separately instead of running in heats, and be judged by the scale of points as laid down and explained. In case only one dog retrieves the brace shall only be entitled to half the number of points for retrieving.

Pennsylvania State Field Trial Association,—The first monthly meeting of the Pennsylvania Field Trial Association was held at Pittsburg, Pa., on Aug. 18th, when it was decided to run the trials at Lancaster, Pa., on Nov. 9th, and several days following. The purpose of the association is the encouragement of the raising and training of pointers and setters. The judges selected are Messrs. B. P. Wilson, of Pittsburg. Pa. Theodore Morford, of Newton, N. J., and Dr. W. Twaddell, of Philadelphia, Mr. B. W. Richards, of Philadelphia, Pa. Theodore signed as a member of the Executive Committee and Mr. S. S. Brown. of Pittsburg, was elected to fill the vacancy. Mr. F. A. Diffenderlier, of Lancaster, was appointed a committee of one (with power to add to the committee at pleasure) to select the grounds for running, and to make all necessary arrangements for the trials. The constitution, by-laws and field trial rules of the National American Kennel Club govern the association. No dog is eligible to run unless he shall have been owned in the State at least three months prior to date of commencement of trial on Nov. 9th. Puppies whelped on or after April 15th previous year are eligible for Puppy Stakes, and the puppies whelped on or offer Oct. 15th, for Nursery Stakes. The trial will include four stakes: First. Free to all—entrance, \$10. Second, Puppy—entrance, \$5. Third. Nursery—entrance, \$5. Fourth. Association—entrance, \$5. No forfeit in any of the above stakes. The frourth is only open to members of the association owning and handling their own dogs. The officers are:—President, J. Palmer O'Neil, Pittsburg, First Vice-President, Mr. Edgar Buidekoper, Meadville. Treasurer, Mr. F. A. Diffenderfier, Lancaster. Secretary, Mr.

Isaac R. Stayton, Pittsburg. Executive Committee Messrs. B. F. Dorrance, chairman, Wilkesbarre; Wil-liam A. McIntosh, Pittsburg; Edward Gregg, Pittsburg S. S. Thompson, Pittsburg; J. J. Snellenburg, New Brighton; and S. S. Brown, Pittsburg.

### THE ST. LOUIS DOG SHOW.

LIST OF PREMIUMS.

THE second annual bench show of dogs, given under the auspices of the St. Louis Kennel Club, will be held at the Fair Grounds, St. Louis, Mo., Oct. 5th, 6th, 7th and 8th, and promises to be one of the granders successes of the kind ever held in the West. Mr. Charles Lincoln has been secured as superintendent, and his well-known proficiency and long experience is a sufficient guarantee that the exhibition will be regulated like cloos-work. We bearn that three of the judges bave been already appointed, and that the one judge system is to be observed. This is as it should be, and a glance at the sub-joined names shows the selection to be a most excellent one in all respects:—

JUDGES.
Pointers-Mr. E. F. Stoddard, Dayton, Ohio.
English and Irish Setters-Mr. C. H. Turner, St. Louis.

Engish and missiscond.

Mo.
Gordon Setters—Mr. E. C. Sterling, St. Louis, Mo.
The judge for spaniels, hounds and other sporting and
non-sporting classes has not yet been selected.
The following is the classification of dogs and the list
of premiums. Fifty-one classes; \$1,130 total amount of

DIVISION A-POINTERS.
Class 1.—Champion pointer dogs, over 55 pounds (see N. A. K.

Class 1.— Champion pointer bigs, ever 35 pounds (see N. A. N. C. rules), \$25.
Class 2.— Champion pointer bitches, over 50 pounds (see N. A. K. C. rules), \$25.
Class 3.— Champion pointer dogs, under 55 pounds (see N. A. K. C. rules), \$25.
Class 4.— Champion pointer bitches, under 50 pounds (see N. A. K. C. rules), \$25.

Chess 4.— Continuou pointer orients, under so pointing see N. A. (\*, rules, §5.\* open Classys.

Class 5.—Pointer dogs, over 55 pounds, §25 and §15.
Class 4.—Pointer hickes, over 56 pounds, §25 and §15.
Class 7.—Pointer dogs, under 55 pounds, §25 and §15.
Class 8.—Pointer pupples, under 12 mouths, dogs, §36.
Class 9.—Pointer pupples, under 12 mouths, dogs, §36.
Class 9.—

show, \$25. Class 12.—For the best pointer, dog or bitch, of any age, by Bow, \$15. Class 13.—For the best pointer, dog or bitch, of any age, by Faust, \$15. Faust, \$15. No entry fee will be charged for classes 12 and 13.

DIVISION B-ENGLISH SETTERS.

Class 11. - Champion English setter dogs (see N. A. K. C. rule 8), 825.
Class 15.—Champion English setter bitches (see N. A. K. C. rule 8), \$25.

THE SHOW, \$25.

DIVISION C - TRISH SETTERS.

Class 23.—Champion Irish setter dogs (see N. A. K. C. rule 8),

Class 24.—Champion Irish setter bitches (see N. A. K. C. rule 8),

25.

\$25. Some relative ditions (see N. A. K. C. rule 8), ODEN CLASSES.

Class 25.—frish setter dors, \$25 and \$15. Class 25.—frish setter there, \$5 and \$15. Class 25.—frish setter purples, under 10.000 ths, dors, \$10. Class 25.—frish setter purples, under 12. months, bitches, \$10. Class 25.—frish setter purples, the property of the setter, \$10. Class 25.—frish setter purples, the setter, dog or bitch, in the show, \$25. privition N—courses.

show, \$25.

DIVISION D—GORDON SETTERS.

Class 3).—Champion Gordon setter dogs (see N. A. K. C. rule 8), \$25. 825. Class 31.—Champion Gordon setter bitches, (see N. A. K. C. rule 8), \$25.

, \$25. OPEN CLASSES.

(See N. A. K. C. rule 9.)

Class 32.—Gordon setter doys, \$25 and \$15.

Class 31.—Gordon setter puppes, under 12 months, dogs, \$10.

Class 36.—Gordon setter puppes, under 12 months, dogs, \$10.

Class 35.—Gordon setter puppes, under 12 months, dogs, \$10.

Class 35.—Gordon setter puppes, under 12 months, birdess, \$10.

Class 35.—Gordon setter puppes, under 12 months, birdess, \$10.

Class 35.—Gordon setter, dog or bitch, in testual, \$25.

DIVISION E-SPORTING DOGS

DIVISION E-SPORTING DOGS.

(Other than pointers and setters.)

Class 33.—Trish water spaniels, \$10 and \$5.

Class 33.—Eocher spaniels, \$10 and \$5.

Class 30.—Forblounes, \$10 and \$5.

Class 40.—Regard dogs, \$10 and \$5.

Class 41.—Beaged dogs, \$10 and \$5.

Class 42.—Erythonius, \$10 and \$5.

Class 43.—Division \$1.

Class 43.—Division \$1.

Division \$1.

Class 44. - Shepherd dogs or colleys, \$15 and \$5.
Class 45. - Bull terriers, \$10.
Class 47. - Bull terriers, \$10.
Class 48. - Bucked and tan terriers, \$10.
Class 49. - Hough-harred terriers, \$10.
Class 50. - Vorskin're terriers, \$10.
Class 50. - Vorskin're terriers, \$10.
Class 51. - Miccellaneous class (for any breed of dogs for which a sass is not priviled). \$20.

class Is not provided). \$10.

Note—Separate entries must be made for all classes marked
"Special," and all dows must previously have been entered in the
regular classes, to enable them to compete in the special classes,
"Norry all the railroad companies have agreed to carry dogs
free, when accompanied by their owners,
The express companies will, on prepayment of their usual rates
to the show, return the dogs free.

NEBRASKA, FIELD TRIALS.—The first annual meeting of the Nebraska Field Trials Club will be held under the auspices of the Nebraska State Sportsmen's Association, at Milford, Neb., Sept. 30th and Oct. 1st and 2d, 1880. It will be open to all connects. Entries will be received up to the evening of Aug. 21st at the Secretary's office, Lincoln, and at any time previous. All entries to be accompanied with the forfeit momey. Trains will leave Lincoln for the trial grounds (Milford, Iwenty miles west) at 7 a.M., on the morning of Sept. 30th, and on each day of the trials. Good accommodations have been arranged for men and dogs at Milford. The arrangements of the trials will be under the direction of the Milford Sportsmen's Club. m's Club

Thus will be mean the mean the means of the following is the premium list:

All-aged Stakes—Open to all setters and printers. First prize, \$75; second prize, \$50; third prize, \$25. Entrance fee, \$15; forfeit, \$10.

Puppy Stakes—Open to all setters and pointers under eighteen months of age. First prize, \$50; second prize, \$35; third prize, \$25. Entrance, \$10; forfeit, \$7.

Brace Stakes—First prize, \$50; second prize, \$35. Entrance, \$10; forfeit, \$1.

In all stakes the purses are to fill, or the prizes to be scaled.

J. H. Harley, Secretary.

EXPRESS CHARGES.—Editor Forest and Stream:—I wish to say a word about express charges from the West. We sent two pups to Mr. Waddell, Topeka, Kan.; charges, §8.50. Belle came in the same box; charges, §8.50. This, we think, is downright robbery, as she only weighed about eight pounds more than the pups.

J. OTIS FELLOWS.

### OF ENGLISH DOGGES.\*

The thirde Section of this

Now followeth in due order and convenient place our Englishe Dogges of the third gentle kinde, what they are called to what was they serve, and what sort of people plant their pleasure in the, which because they neede no curious canua-sing and nye sylting, wee meane to be so much the briefer.

Of the delicate, neate, and pretty kind of dogges called the Spaniel gentle, or the comforter, in Latine, Melitarus

or Fotor.

forter, in Latine, Melitæns or Fotor.

There is, besides those which wee hane already deliance of the selection Melita, in the sea of Sieily, (what at this day is named Melita, an Iseland in deede famous and renounced, with couragious and puisant soldiours valicationally lighting ynder the banner of Christ their viconquerable captaine where this kind of dogges had their principall beginning.

These dogges are little, pretty, proper, and fyne, and sought for to satisfie the delicatenesse of daintic dames, and wanton womens wills, instruments of folly for them to play and daily withall, to trylle away the treasure of time, to withdraw their mindes from more commendable exercises, and to content their cerrupted concupiscences with vaine disport (A selly shift to shunne yreksome ydleness.) These puppies the smaller they be, the more pleasure they prouoke, as more meete play fellowes for minsing mistresses to bear ein their bosons, to keepe company withal in their chambers, to succour with sicepe in bed, and nourishe with meate at bourde, to lay in their lappes, and licke their lippes as they ryde in their waggons, and good reason it should be so, for coursenesse with finenesse hath no fellowship, but featnesse with neatnesse hath neighbourhood enough. That plausible prouerbe verified ypon a Tyraunt, namely that he loued his sowe better than his some, may well be applyed to these kinde of people, who delight more in dogges that are deprined of alt possibility of reason, then they doe in children that be captable of wisedome and indgement. But this abuse peraduenture raigneth where there hath bene long lacke of issue, or else where barrenes is the best blossome of bewty.

\*Of Englishe Dogges, | the dinersities, the names, | the natures and the properties. A short | Treatise written in latine | by Johannes fains of late memory of Philistop in the Universitie of Common Properties of Philistop in the University of Common Properties of Common Student, | Natura etian in brutise in | oden distant, | Scene and allowed, | Timprinted in London | by Richard Johnes, and are to be | solido over seatherts, Sepul. | chee's Church without | Newsate | 1876

The vertue which remaineth in the Spaniell gentle a otherwise called the comforter.

otherwise called the comforter.

Notwithstanding many make much of those pretty puppies called Spaniells gentle, yet if the question were demanded what propertie in them they spye, which shoulde make then so acceptable and precious in their sight, I doubt their annowere would long a conying. But seeing it was our intent to trauaile in this treatie, so that y' reader might reape some henefite by his reading, we will communicate who you such coniccures as are grounded ypon reason. And though some suppose that such dogges are fyt for no seruice. I dare say, by their leaues, they be in a wrong boxe. Among all other qualities therefore of nature, which be knowne (for some conditions are couered with continuall and thicke clouds, that the eye of our capacities cannot pearse through they we find that these little doges are good to asswage the sicknesse of the stomacke being oftentimes therewito applied as a plaster presentative, or borne in the bosom of the diseased and weake person, which effect is performed by theyr moderate heate. Moreouer the disease and sicknesse, chaungeth his place and entreth (though it be not precisely marcked) into the degge, which to be no variful, experience can testify, for these kinde of dogges sometimes fall sicke, and sometime die, without any harm, outwardly inforced, which is an argument that the disease of the gentleman or gentle woman or own rehalsomer, entreth into the dogge by the operation of heate intermingled and infected. And thus haue I believe to handled dogges of a gerdle kinde whom I haue comprehended in a triple duisio. Now it remaineth that I ammex in due order such dogges by so of a more homely kinde.

### KENNEL NOTES.

RENAEL NOTES.

SALES.—Nauey—Mr. N. Elmore, Granby, Conn., has sold his fine black and tan foxhound bitch, Nancy, to Mr. Charles F. Horton, of Wakefield, Mass. Victor-Lucy, whelp—Mr. N. Elmore has sold a very bandsome white, black and tan English hare beagle puppy, Victor-Lucy, to Mr. Waddo A. Howland, of Lowell, Mass. Victor-Bunnie, whelp—Mr. N. Elmore has sold a fine, two months old, beagle-dog puppy, out of Bunnie by Victor, to Mr. Franklin Clearce, of Saco, Maine. Victor-Lucy, whelp—Mr. N. Elmore has sold a fine English hare beagle dog puppy, out of Lucy by Victor, to Mr. A. A. Atklus, of Turner's Falls, Mass. Victor-Lucy, whelp—Mr. N. Elmore has sold a fine black and tan English hare beagle puppy, out of Lucy by Victor, to Mr. H. G. Jerome, of Gale's Ferry, Conn.

CORRECTION.-Belle-In issue of Aug. 12th, we noticed sale of this cocker spaniel bitch. She was out of Blanche by Beau, not Bean, as printed.

WHELPS.—Baisy—Mr. James Page Stinson's, Wiscosset, Maine, pointer bitch, Daisy, out of Belle by Strachan's Flash, whelped Aug. 13th seven puppies—five dogs and two bitches—by Hubbard's imported Shot. All the puppies are liver and white. Cypic—Mr. C. Z. Miley's, Lancaster, Pa., pointer b'tch. Cyrde, whelped on Aug. 13th ten puppies—six dogs and four bitches—by Rock. Nellie Horton—Mr. George E. Brown's, Dedham, Mass., Gordon setter bitch, Nellie Horton, Munn's Duke of Gordon-Tilley's Dream, whelped Aug. 18th, seven puppies—four dogs and three bitches—by Doane's Tom-Stockton's Dash-H. Smith's Fly.

DEATH.-Stoughton-Mr. M. P. McKoon, of Franklin, N. Y., as lost by diarricea his cocker puppy, Stoughton, by Captain

Baed, - Fly-Music-Dr, H. B. Wygant's, (Peckskill, N. Y., nocker-spaniel bitch, Fly, to Mr. Geo. Wygant's first-prize winner, Music.

The Rifle.

### RANGE AND GALLERY.

Dr. Rumi's Extration Shoot — Dr. John Ruth, the California shot, of whose performances so much has been said in the papers, gave the first display of his ability as a marksman at the grounds of the Fountain Gun Club. In the Brooklyn Driving Park, on Saturday afternoon last. The Doctor is the Western man out and out—long and lithe of finity, while his hair sweeps back over his shoulders. A broad, light-tinted fett hat, with a velvet shooting-lacket, gave the Doctor a marked appearance. Mrs. Buth is a lady with a very much tanned complexion and the carriage of a backwoods woman. She wore a sort of Gainshorough hat, and when handling the pistol or rifte dain and even make the trouble to remove her face mitrs. Capt. L. C. Bruce, the celebrated rifle shot; C. W. Wingert, the Secretary and one of the eracks of the Fountain Gun Club; T. C. Banks, and many expert shooters, were present, and watched the performance narrowly, and ad united in declaring that Dr. Ruth was fully the equal of any other such marksman who has yet rande his appearance DR. RUTH'S EXHIBITION SHOOT -Dr. John Ruth, the Califor-

and ad united in declaring that Dr. Ruth was fully the equal of any other such marksman who has yet made his appearance about New York.

The performance was opened by Mrs. Ruth aiming with a pistol at glass balls, and they were stattered in almost every case. With the pistol held sideways there was a miss or two more, but generally every shot told. When the pistol was inverted and the aim taken below instead of above the line of fire there was no apparent loss in the percentage of hits. When the ball was himp by a string and set swinging Mrs. Ruth stood 18 yards off and made a clean break on her first shot. The ritle was then handled through the same series of shots, and the usual want of grace with which all women handle guess was apparent; but if the weapon was not brought to shoulder with the lary swing of the old marksman, the halls were the ligists as accurately. When the balls were thrown up in the air Mrs. Ruth stood a good distance off and shattered a dozen out of the fifteen, and this feature, when ecored, was equally as good.

dozen out of the fifteen, and this feature, when encored, was equally as good.

Dr. Rith next began to show his ability as a snap shot. The sights of the rifle scemed to be of no special assistance to him, for when they were covered by a card he used the weepon on bails placed on the stand and against the glass spheres thicken

Into the air, with wonderful effect. Some bells were thrown on the ground a dozen yards off, and the Doctor, afmit at the ground below a ball, would send it spinning op into the air, and then all the spinning op into the air, and then a provided by unleading and loading his Winchester, would hit he ball on its descent. This double shooting drew out plenty of applause. Again, when the balls were thrown up, the ritle was given a turn about after the manner of a fali-handle and it fell into position soon enough to enable a breaking shot to be made on the ball. Balls thrown from side to side were hit, whether coming from the right or left. When tired of breaking the spheres Dr. Ruth picked up a fragment of glass, and stepping off a dozen paces herd it, off in his flagers, while Mrs. Ruth, picking up a .22 calible Ballard ride, took careful aim and the glass was shattered into powder. With an ordinary visiting eard held his wife to not several bullets throughli, the couple loking meanwhile with each other, the shooter telling the target to draw back his mose a little, as it was too shiring a mark and distracted her light. Dr. Ruth wished to put a glass ball on his head and allow his wife to break it with a bullet, but she declared that she was tired of standing in the sun, and this very ordinary Wm. Tell trick was omitted. A loaded cartridge was laid on a bit of a plant some yards off, and Mrs. Ruth fired a bullet at it and exploded it. Dozens of other and similar ways of testing the quickness of sight and steadiness of nerve of the shooters were improvised, and generally it was found that on pilof gired at was bit almost every time. When the exhibition had closed a few of the carcias present tried their skill, and began to appreciate somewhat the real merit of the Doctor's doings by the facility with which they missed. what the real merit of the Doctor's doings by the facility with

which they missed.

Dr. Ruth and wife will give an exhibition of their skill with the rifle and pisto on the occasion of Buffalo Bill's benefit to-morrow night, the 27th inst., at the Windsor theater.

row night, the 27th inst., at the Windsor theater.

BOSTON, Mass., Aug. 18th.—There was a fine attendance of riffemen at Walnut Hill to day to compete in the continued long range match. The wind in the earlier stages of the shoot proved troublesome, moving back and forth from southwest to south east, but at the last two distances it remained steady, blowing from the southeast, and good shooting was the result:—

### THE GREEDMOOR FALL MEETING.

THE Board of Directors issued the programme of matches for

THE Board of Directors issued the programme of matches for the full meeting to open at Creedmoor on the 14th prox. There is no very ambitious showing of prizes, for out of a prize list of over \$7,60 only \$182 is in cach, \$1,811 being in prizes of kind, while \$1,700 are in the shape of returnable trophies. It will be no place for mug-hunters, or those who shoot for the ducats, but there is variety enough to enable a ridieman to try his skill at all ranges, and while the small-bore men have been remembered a liberal share of the matches are adapted to military-booters particularly. The prize donors send in a curiety of articles, all of value and worth to shooting men.

Hartley & Giaham, of 19 Maiden Lane, send a fine revolver, etc., W. S. Kimball & Co., of Rochester, send many packages of vanity Pair tobacco; the Huzard Powder Company, of S. Wall street, enable marksimen to get samples of their fine wares by shooting for them, while Tilany & Co. contribute a fine silver vase, and the Winchester Arma Company are represented with their new Motch new Hotch

Winchester Arms Company are represented with their new Horch The individual matches of the meeting include the fol-

for them, while I'flany & Co. contributed line silver vase, and the Winchester Arms Company are represented with their new Hotch-kiss gun. The individual matches of the meeting include the following:—

Steward's Aggregate Prizes; offered annuality by Mr. J. H.

third prize, \$15. Steward's Aggregate Prizes; offered annually by Mr. J. H. Steward, optician, N. R. A., 406 Strand, London, W. C., England. The disposition of these prizes will be announced later.

The disposition of these prizes will be announced later.

A New Pirit-Alux.—Lieut. Andrew H. Russell, Ordanace Corps.
United States army, who is at present stationed at the Watertown
Arsenal, Mass., has taken out letters-patent, dated Aug. 3d, 1889,
on an improved magazine fire-arm. His invention relates to the
class of small arms designated as bolt guns. Some of the features of his system, he calaims, can be employed beneficially with
machine guns and with breech-loading cannon, by increasing the
size and strength of the parts. The favoration is very ingenious.
Lieut. Russell claims 32 combinations of ideas embraced in this ew fire-arm.

### Archern.

-Address all communications to "Forest and Stream Publishing Company, New York."

Highland Park, \$P\_\*\$, 419, 10th.—The following is a report of the first of three matches arranged between the Wabash Merry Bowmen and the Highland Park Archers. The conditions were teams of six, \$\particle{9}\$ arrows at \$\particle{9}\$ yards, each club to shoot on its own ground on same day, and report scores by mail. The Merry Howmen, being able to get out only five men, authorized the Highland Park Archers to disregard their lowest score in deciding the match. Consequently, the gross scores are as follows: \( \frac{4}{3} \) \( \frac{1}{2} \) = 1,984 Wabash Merry Bowmen. \( \frac{1}{3} \) \( \frac{1}{2} \) = 1,984 Wabash Merry Bowmen. \( \frac{1}{3} \) \( \frac{1}{2} \) = 1,984 Wabash Merry Bowmen. \( \frac{1}{3} \)

Highland Park Archers win by 6-126.

W. H. Thompson M. Thompson Booe Dr. McMechan Klein	21—109 22— 98 17— 75	$\begin{array}{c} 22 - 122 \\ 21 - 75 \\ 21 - 101 \\ 15 - 59 \\ 18 - 78 \end{array}$	23 - 115 $20 - 110$ $23 - 103$ $15 - 75$ $17 - 73$	23-113 22-110 21-101 18 - 78 19- 69	92 - 496 84 - 40 87 - 406 65 - 28 68 - 28
Grand total					
1	HIGHLAN	ND PARK	ARCHERS.		Totals.
Hammond Hall Kyle.	17— 87 22—124 17— 83	$\begin{array}{c} 20110 \\ 2185 \\ 21105 \\ 21107 \\ 1896 \\ 24104 \end{array}$	$\begin{array}{c} 20 - 110 \\ 24 - 110 \\ 22 - 102 \\ 19 - 77 \\ 22 - 118 \\ 21 - 79 \end{array}$	21-103 $23-137$ $20-98$ $19-81$ $16-82$ $23-97$	84-43

Grand total... 481 2.366
The above score, made by the Highland Park Archers; has one rather remarkable feature in it. It not unfrequently happens that the archer making the highest score, makes a less number of hits than the second or third man. But it probably very rarely happens, as in the above case, that the sixth and lowest score is accompanied by the largest number of hits. This case well illustrates the different results sometimes obtained in scoring by gross scores allow, and in scoring by points, the method now adopted by the National Association in shooting for the champion medals. of the rational Association in shooting for the champion means if we give two points for best gross score, and two for greatest number of bits, and consider each 24 arrows by itself, giving one point for score and one for bits, we shall have 12 points, and di-vided among the archers as follows:—

vided among the archers as follows:—

Dr. Weston Points.

Dr. Weston I Mr. Kyle.

Points.

Mr. Startwont I Mr. Kyle.

I Mr. Street I Mr. Kyle.

I Mr. Hall.

O In scoring by points can we more accurately determine the relative skill of the shooters, as shown in a given match? It will be noticed that two changes have been made in the different arrangements. Dr. Weston goes from last to first place, and Mr. Hall from third to last. Is this fair? Points say so. Dr. Weston made the greatest number of hits, and a larger number than any member of the club ever made, and points reward him with first place. Mr. Hall, though making a fine score, was not first either in hits or score in either 24 arrows, and points put him last. In scoring by points, as a rule, the archer making the greatest score would be the winner. But we see this would not always be the case. score would be the case.

### Gricket.

-Address all communications to "Forest and Stream Publishing Company, New York."

ORIGIN OF ROUND-HAND BOWLING,-We shall publish in next week's issue an interesting letter on the subject of the origin of round-arm bowling. It comes from an old personal friend of Mr. Wills, perhaps the only survivor who knew Mr. Wills and his charming family personally. The account differs materially from those that have been handed down in cricket annuals and companions, and will be of interest to our readers. It will be remembered that the introduction of the new style created quite a stir among cricketing circles at the time which Mr. Wills tried on at Marylebone, we think, in 1822, but which the authorities would not permit. This excited the wrath of Mr. Wills to such a degree that he left the ground, and his place, by agreement, had to be filled up. The loss of such a man, at such a time (England vs. Kent), caused a considerable amount of ill expression by the backers of his party, although in the end Kent defeated Marylebone signally,

-Eleven Lucases played and defeated the Horsham Cricket Club Aug. 3d and 4th.

The United States-Canada match, as above noticed, will be —The United States-Canada mater, as above noticed, win be played in Philadelphia Sep. 13th and 14th. We sincerely trust that both the associations of Canada and the United States will arrange to place representative teams in the field. According to the rules, the actual traveling expenses of players going to Philadelphia to play against Canada will be defrayed out of the proceeds of this match

-The Cricketers' Association of the United States has decided to principle of the benefit of the association, to be played at Philadelphia Oct. 6th and 7th. If has been suggested to select elevens as follows: one composed of members under thirty, and one of those who have reached three decades.

—Eleven Americans will play eleven Englishmen, Sept. 22d and 23d, at Stenton. The Girard Club will select the English team, and the American team will be chosen by the Young America

-Mr. E. Kearney, of Halifax, has kindly sent us an excellent photograph of the "Canadian team," which recently visited Engand, It shall be placed in our large collection of cricket pic-

-The Philadelphia match committee has written Mr. Alexander, manager of the Australian team, that it would be unable to arrange a match as desired by him.

—The Staten Island Club's first-eleven was engaged to play the Longwoods on Saturday last at Boston, but was obliged to excuse itself, as a team could not be found to go.

LONGWOOD 28. HAMILTON.—First match of the Longwood's tour to Canada. Played at Hamilton, Aug. 9th and 10th, and after a nip and tuck contest resulted in favor of the tourists by 9

J. K. P., Dardanelle, Ark.—We cannot advise you to spay your

young bitches, believing that the practice is inhuman and apt to

young orders, presering that the practice is infiliated and apt to injure them for steady field work.

C. Woonsocket.—The Connecticut Lakes region is an excellent place for you to camp in September. Read the description in the Forest AND STREAM of April 20th, 1889.

H. D. P., Brooklyn,-The information which you refer to was

11. D. P., Brookfyn.—The information which you refer to was correctly given. Both gentlemen are alive. If you address them at this office your letters will be forwarded.
W. P. D., Lockport, N. Y.—The pedigree of Mr. W. A. Robinson's Jack is as follows: Jack, by Putnam's Dan out of Palmer's

son s anok is as follows: Jack, by Pultam s Dan out of Palmer's bull imported Belle; Dan, by Palmer's Dash, out of Pultam's Kell. J. H. R., Three Rivers, Mich.—11 is extremely dangerous to in-terfere with the laws of nature, and therefore we cannot advise you to resort to any artificial means for purposes which in the end are defeated.

W. H. D., Boston.—The following are the addresses which you write for: Mr. R. J. Lloyd Price, Ithiwlas, Bala, Wales, and Mr. J. Fletcher, Stoneclough, Manchester. We have written for the in-

formation you require.

J. B. T.-Use leg-of-mutton sail for boat 21ft, long and 40in

J. B. T.—Use leg-of-muiton sail for beat 21ft, long and 46in, wide. Step mast about 31ft, from bow; sail 10ft, 6in, on frost and 13ft, on mast, of triangular shape. Will sail better with 2 or 3in, keel, or try a lee-board about 14ft, long with 6in, dip full length. Limeaters Boy, Williamsburg, N. Y.—Meadow iarks and robins are protected by the State law until Oct. 1st, and the supervisors of counities have power to protect them beyond that period if they see fit. Highholders (woodpeckers) can never be killed in

W. H. C., Springfield, Mass.—A. F. Nims, Agent R. W. and O. R R., at Canton, N. V., khodly furnishes the fellowing: Railroad fare from Springheld eta B. and A. N. Y. C. and R. W. R. R. to De Kalb Junetion, §3.89; to Canton, §505; to Potsdam, §506; by stage and private conveyance from either of above named places.

C. C. W., New London.—What kind of a dog should I purchase to make a first-class squirred dog, and where can I procure one?

Ans. Either coarse-halred black and tan or Scotch terrier could be trained to make a killing dog. We have generally seen cut dogs used, and if you procure a sharp, lively one he will be all that you will require.

that you will require.

Don, I have an Irish setter four months old; he seems in good health; nose cold and most, coat glossy, but has a habit of your-ling up his food almost as soon as be has caten it. What shall I do for him? Ans. Perhaps he is overfed; if not, give him a few doses of sulphur, followed by a dose of castor oil, and feed him

on light diet for a week.

E. B. L., Messengerville, N. Y.—The pointer dog Mack, bred by
Mr. James Warburton, New Britann, Conn., and winner at the
Centennial Bench Show, was sold to Dr. L. Corcoran, of Spring-field, Mass. Mack's pedigree is as follows: Whelpei June, 1874, Centennial inend isnow, was so in to Dr. L. Corcoran, or Spring-field, Mass. Mack's pedigree is at follows: Whelped June, 1874, liver and white; by Don out of Cute; Don by Rap, out of Nell; Carte by Shot, out of Fanny. C. P. E., New Jersey.—I. Where can I obtain lists of price wavels in W. K. C. Bench Shows for 1875, 7% and 792 2. To whom must ap-

in W. K. C. Bench Shows for 187, "85 and "97? 2. To whom must application be made for information concerning stud services of champion Lark? Ams. I. Back files of this paper will give you the information you want. 2. Audress Mr. P. H. Morris, office Derby Paper Mills, 72 and 71 Duano street, New York. V. B. M., Ralegia, N. C. —Please inform me how to feach a dogahout three years old, to retrieve. Ans. We cannot do better flust to refer you to articles on dog breaking in Fourist Ams. Stricking of March 18th. April 8th, 15th, 22th, and May 13th. These articles cover the matter in tail. We presume, from your inquiry, that no attempt has ever been under to make your dog force.

I B B Savannah Go - A little boy of mine is collecting eggs. J. B. R., Savannah, Ga.—A little boy of mine is collecting eggs, and I wish to get some information on the subject. What book can I get that gives good descriptions of eggs? Ans. Baird. Brewer and Ridgway's N. A. Brust is probably the best book for jour boy; Four vols, 810 each, uncolored plates; \$20, colored Soveral works on cology are now publishing, but will not be com-

w. F., Palo, Mich.—My pointer puppy for which you prescribed w. F., Fino, since, "a) pointer pulpy for which you presented for the image some time ago, has recovered from that, but is still very poor in flesh, and all my efforts to get flesh on him are fruitless. He is in good health and spirits, and is very lively. I am feeding him two meals per day, morning and ovening, and have been giving him two drops of Fowier's solution twice a day. Ans. Good feed twice a day, a healthy kennel and proper exercise is all that is required, unless the dow has worms, in which case he

Ans. Good feed twice a day, a healthy kennel and proper exercise is all that is required, unless the dow has worms, in which case he must be treated for their removal.

R. E. C., Evansville, Ind.—Picase be kind enough to state the name of all foods eaten by Dr. Tanner since his forty days fast, to gain flesh and fat; also please give the name of the wine he is drinking and where it can be purchased. Ans. The details of "Dr." Tanner's performance became so nauseating that we did not follow them. We cannot give the particulars of his eating and drinking. We refer you to the daily papers of that date, which had nothing better to fill up their columns with—we have. D. L. S., Franklin, N. Y.—Tae highbolder is always protected in this State, the haw reading: "No person shall, at any line, within this State, kill, expose for sale or have in possession after the same is killed, any eagle, woolpecker, night-hawk, yellow bird, when the same is killed, any eagle, woolpecker, night-hawk, yellow bird, we have the production of the same shall be deemed guilty of a misterment, and in addition thereto shall be deemed guilty of a misterment, and in addition thereto shall be deemed guilty of a misterment, and in addition thereto shall be deemed guilty of a misterment of the same plane to this killed, exposed for sale or had in possession." The less amendment to this kaw allows the killing of robins after Oct. 1st. S. S., New York.—Can you tell no where woodcock go, when they leave the swamps in the latter part of July? Ans. This is a question that has been debated for years, and no very satisfactory conclusion has yet been reached with regard to ft. Much de-

pends on atmospheric conditions. We know that some of the pents on atmosphere conductors. We know that some of the birds take to the cornicides and spend much of their time there, others go into the mountain swales, and still others take to high dry pasture hills, where they may sometimes be started from under the cedars and low growth of bushes.

F. W. W., Charlestown, Mass.-In Annapolis County, Nova otia, you will find moose, cariboo, bears and smaller game, with Scorms, you wil am mioose, carrier means a smaller game, with plenty of good trout fishing. To shoot you will be obliged to take out a fleens; fee, \$50. 2 Red or brown backles are most allways good; the former of the water is not too bright and clear, with a blue durf and opper. Take along an assortment, such as black grant, adder fly, gray and green drake (May likes), scarled this, fern fly, coachman, etc. Do not frust one or two kinds. The caprices of trout are past finding out, and the fly which was so killing yesterday may be worthless to-day.

so killing yesterday may be worthless to-day.

John Smith, Perth Amboy.—Kindly tell me if a setter dog
that has become nearly deaf through cankered cars, can be
cured or even remedied; if so, what treatment would you advise? I have a very good getter that is almost entirely deaf, and
can hardly hear a shrill whistle lifty yards. Ans. You omit to
give age of dog and how long he has had canker. Such cases are
seldom ever bettered by treatment in so far as hearing is concerned. Keeping the cars clean with tepid water is, perhaps, the
most you can do. It there is a descharge, use a little diluted lead
water as an injection after washing a way the discharge.

most you can do. If there is a discharge, use a little diluted lead water as an injection after washing away the discharge.

C. J. C., Oregon.—Please inform me if the fish mentioned at head of column as Scharg fontinalis is different from the one mentioned in the same place a few months as Salectinus fontinalis? If not, why the change? Ans. They are the same. The fish has long been known by the first name, but last year the samon fundity was revised and a new genus made, called Schelmus. The older name is more familiar to angiers, and all induralists have not yet signified their acceptance of the new genus, so we, in revising our whole dishing department, have chosen to place the old name there. Every angler knows Salmo fontlimits (a,be the Eastern brook trout, and the name has because so popularized that we shall retain it for a while and see how the new name takes.

Y. B. M., Ralcigh, N. C.—I. Should the locks of a gun be olded once every year? Supposing you use it quite often during the fall and winter? If so, how much oil is necessary? Should you just dampen the machinery, or put considerable on? The locks I have reference to are good ones, on a Scott gun, special grade, purchased last fall. 2. Will a No. 11 was fitted in a No. 12 shell on a charge of Dittimar powder, cause as effective an explosion as two No. 12 wads on same charge? Ans. Once a year with good all squite enough, unless the gun bas been much exposed in weat and dry weather. As a rule, the less locks are meddied with the

plain in full. Ans. What one man may consider a "thoroughly broken" dog for his own use may be far from meeting the view of his neighbor. We consider no dog thoroughly broken who does not mind implicitly, range well, point, stay to his point until the bird is flushed by the sportsman, or moved by the dog when ordered "on." The dog should back, drop to shot, or stand per-fectly still when bird takes wing. He should refrieve with a tender mouth and deliver the bird to band. The arrivoles on dog breaking recently published in FOREST AND STREAM COVER OF tideas of what a dog should do and not do. We refer to them in an swer to V. R. M., in this column. Read them.

E. J. H., Sauk Centre, Minn.-Inclosed is as good a description The first state center, similar incloses as good a description of a fish as I can jour toll me the name and to what Lamby it belongs? It is the exact size of the fish, for I laid it on the paper and drew around it. It was caught in a small lake where there are only three other kinds of fish, sunish, built-heards, and another that I do not know the name of. The lake has no outand another that I do not know the flame of. The first has no out-let or inlet. It is the only lake that I know of it on rpart of the country that has any fish but what has large fish in it; this has none. Can you give me the name of a good fish book, who it is published by, and at what price? Aus. Your fish may be what Jordan calls the new-world minnow (Phaziman newga us) of Ope, Send us one that has been a few weeks in alcohol. Wrap it in cloths wet with spirits. What kind of fish book do you wa

A MUSICAL AND SYMPATHETIC ELEPHANT. - An American Me-A MESICAL AND SYMPATHETIC ELEPHANY.—An American magerie and circus proprietor announced lately for his benefit, a learned elephant to play some pieces on a "magnificent Brinsmead." Every one rushed to hear the tusked virtuoso, and a large mead." Every one rushed to hear the tusked virtuese, and a large amount was taken at the door. Before the end a new piano was brought into the middle of the circus and the top removed. After the usual obeisances, the elephant advanced to the piano. Italsing his foot, be placed it on the keys. Suddenly he uttered a fearful cry, which sounded like weeping, and occasioned no small alarm. The proprietor came forward and stuck his head in the the animal's jaws to learn the reason. Taking his head out again, he ordered the tusked virtues to be led away; then turning to the audience, said the elephant could not play on that piano, as

in the keys of the instrument be recognized the teeth of his A Broadwood was immediately telegraphed for to

We suspect that the above, which comes to us from London, contains the covert advertisement of a piano manufacturer, but the elephant must nevertheless go on

AN AFTER SCRATCH.—One day last week I saw my old cocker "Fannie" while going at full speed go on three legs and try to get burrs off her belly with the other; too busy to stop for burrs when there was a chance to get up a woodcock.

—Some Parisian ladies have taken to frog shooting. The arm they use is a highly ornate steel cross-bow, from which a dart may be discharged with sufficient force to transfix the most corpulent and tough-hided of frogs at a range of twenty feet. By means of a silken cord this missile is attached to the breech of the cross-bow, a contrivance enabling the successful markswoman to dispense with the services of a retriever for the collection of her game. Having shot a frog, she can band her wriggling wittin to her very feet, where the duty of "bagging" it devolves upon her keeper. From live to six brace constitute a good average bag, and furnish a succelent dish of slender hind legs, delicately fried in batter. -Some Parisian ladies have taken to frog shooting.

## Forest Stream

NEW YORK, THURSDAY, SEPTEMBER 2, 1880,

ANONYMOUS LETTERS .- There is one form of epistle frequently received in all newspaper offices to which, besides a cursory glance and a toss into the waste basket, no further thought is ever given. If these letters, which usually come signed "A Reader," "Truth," or perhaps by the dishonestly assumed title of some organization, are full of petty spite, unmerited personal abuse, insinuations, inuendoes, hints, vituperations, threats and stage fury, they are apt to provoke a laugh or an impatient grimace, according to the mood of the recipient, but beyond this—nothing. An anonymous letter intended for publication may be, if it finds its way into print, either contemptibly ridiculous or cowardly and mean. Consigned to the waste basket, it can be neither; and such is the fate of all such letters which come to the Forest AND STREAM, even when their peculiarities of handwrit-ing disclose their authorship. The individual who pens abusive letters and sends them to this office anonymously is simply wasting time, ink, paper, postage and, let us hope, is sacrificing self-respect.

GERMANS AT THE BUTTS.—The New York Schuetzen Corps, Major George Aery, captain, will hold their annual fall festival at Thompson's Pavilion, at the Highlands of Navesink, on the 14th and 15th of September. Special arrangements have been made for the transportation and hotel accommodation of the entire corps, with their invited guests. The interesting features this year will be off-hand shooting, as usual, and prize bowling by ladies. none but those accompanying the members of the association being allowed to compete. There will be a ball the first evening, and an excursion and a fishing match for the ladies the next morning.

#### THE COMING FIELD TRIALS.

ROM the inauguration of field trials in America, at Memphis, Tenn., in October, 1874, up to this date, this mode of practically testing what a dog really is at bottom has steadily been gaining favor in the eyes of the American breeder and sportsman. In this, and in last week's issue, the Forest and Stream contains a list of the coming autumnal fixtures, the official programmes of each event, the data of management, and the rules by which each trial is to be governed and under which it is to be run. We have published these in full, acknowledging their great necessity and confidently expecting that the growing interest will increase until we shall see every State in the Union have its own field trials club and its annual competitions. Meetings of this kind are of paramount importance, not only as a means of bringing our sportsmen into contact, thus affording an opportunity for them to compare notes, and from their experience improve their breeds, but also as opening a way to infuse a greater admiration for the noblest and most intelligent of all dumb animals. Rightly conducted, field trials cannot but tend to raise the standard of the sport of shooting game birds, and greatly to increase the number of well-broken dogs. A perusal of the rules of both the National American Kennel Club and the Eastern Field Trials Club shows us that several of them have not been drawn up as carefully as we would wish to see. One in particular does not meet our views. We refer, to the instruction to judges on the subject of chasing. We consider this so grievous a fault that the dog so offending should be instantly disqualified as unworthy of a place in the competition. As dogs, and particularly young ones, are imitative, it can be readily seen what a deal of harm such a bad example might produce. We would not shoot in the field with a man who owned a brute that ran his birds. Evil communications, certainly in dog flesh, as among men, are quite sure to corrupt good manners

No laws for competitions of this kind can be too fully or plainly expressed. They should be explicit and admit of but one construction. The success of every enterprise depends upon the straightforwardness and intelligence by which it is run. Indefinite rules, framed carelessly, even by-inadvertence, are liable to be twisted by interested parties so that they shall seem to mean the very opposite of what is intended. Dissension and cavil rob all true sport of its pleasures, and disgust all men of gentlemanly instincts. Wherever competitions of any kind take place there have been since the world began men who cannot take a beating in a manly way; and occasionally persons are met with who would resort to any means to bring about their own desired results. If they cannot wing they do not wish to see their neighbors do so.

As a protection for the judges, the laws and instructions should be clearly given, and it will cause the gentlemen who accept the onerous office much trouble if they are not. Fortunately the selection of judges thus far has been most excellent, and we cannot let this opportunity pass without congratulating the committees we have heard from on their tact and the soundness of their choice, and their good fortune in having these gentlemen accept. As long as such men as Messrs. Morford and Wilson, Capt. Henry and Dr. Twaddell are found to the fore, there need be no fear but what every owner will get his dues.

Mh. Oben's Return.—Mr. Frederick A. Ober (Fred Beverly) arrived in this city, from St. Thomas, last Friday. Mr. Ober began his ornithological explorations of the Lesser Antilles in 1876 under the auspices of the Smithsonian Institution, and was engaged in them two years, when, the funds giving out, he was obliged to return, with the work unfinished. The great success of this mission in a scientific way (twenty new birds having been discovered and a vast amount of information respecting the islands having been obtained) impelled Mr. Ober to return and complete a work so auspiciously begun. But a few islands of the chain remained unexplored, and a few hundred dollars would have been sufficient to complete the survey. Even this small amount

the Smithsonian was unable to advance, and consequently Mr. Ober wentjout, at his own expense, to finish a work which should have been accomplished by aid from English or American scientific societies.

The result has been highly satisfactory, as several new birds have been discovered, much new information elicited regarding the topography of the islands, as well as the fauna, and the scientific world is to be, for the first time, put in possession of a complete history of the birds of the Lesser Antilles. The catalogues of the birds of each island will be published in the "Smithsonian Reports," supplementing the other various catalogues published two and three years ago. Mr. Ober has with him a live specimen of the great imperial parrot, inhabiting only a single island in the Antillean chain, and known nowhere else in the world. He sent, three years ago, the first skins of this bird that ever reached the United States, and now brings the first specimen alive. He has also a pair of agoutis-animals peculiar to South America and the West Indies—and a monkey, peculiar to one of the islands, about which the naturalists are in doubt-as to the species-whether it is an inhabitant of the new world, or was introduced from Africa.

This question, as well as many other curious and interesting problems that have vexed our scientists for years. will be settled by the specimens now in possession 'of He has visited every island between Porto Mr. Oher. Rico and Trinidad, and among other recent visits has paid one to the famous Boiling Lake of Dominica, which surprised the inhabitants of that island last January by an eruption of hot water, mud and stones. In the interval between his two exploring trips Mr. Ober wrote a book describing his adventures in the forests of the Caribbean Islands. This book was published by Messrs. Lee & Shepard, Boston, and has since appeared in England, meeting with a good reception on both sides the Atlantic. Having made engagements to lecture this winter, he returns to fulfill those engagements and to write out the further adventures of his recent trip.

PACIFIC COAST FISHES.—The west end of the United States Fish Commission, composed of Prof. D. S. Jordan and Mr. C. H. Gilbert, are actively at work. They have made stations for collection and study of fishes at San Diego, San Pedro, Santa Barbara, Monterey and San Francisco. Twenty-eight species, new to science, have been introduced into the system thus far by them, viz.: A sole (Aphoristia); a flounder (Pleuronichthys), and two new genera of flounders. A new ray (Raia); a sting-ray (Dasybatis); a ray of a Chinese genus (Platyrrhina), and a ray of a new genus; two new Embiotocoids (genera Abeona and Brachyistius); three new blennies (Xiphister-two species; Apodichthys, one); a new Agonus, and a new deep water fish, which, with one previously described by Mr. Lockington, seems to constitute a new family (Icosteidæ), and, finally, no less than thirteen new species of the "rock fish," genus Sebastichthys. These, with the twelve species previously known, are now all brought into the San Francisco markets with more or less frequency. Most of the new species are from deep water, and were not in the markets in Dr. Ayres' time, twenty years ago, since which time no one has attentively studied this group on our coast,

Numerous species known from further south have been added to the United States fauna. Notable among these are eight sharks: the great basking shark (Cetorkinus); the man-eater (Carcharodon); the tiger shark (Galeocerdo); the mackerel shark (Isurus); the swelling shark (Cephaloscyllium); the horned shark (Pleurocromylon); the blue shark (Carcharinus); and the oil shark (Galeorhinus).

JOSEPH W. LONG.—Joseph W. Long, the author of "American Wild Fowl Shooting," died recently at Osceola, Nev. Mr. Long was well known as a practical gunner, and his book holds a deservedly high place among the few books of sport that are really worth anything.

—The very interesting review of the work of the Fish Commission will repay a careful perusal. It is a good showing of results.

### The Sportsman Tourist.

ROUGH NOTES FROM THE WOODS.

HOW THE RED MAN WATCHES A LICK-CAMPING, COOKING AND ANGLING-INDIAN WOODCRAFT,

W HEN Chief William led up to the lick he took me THEN Chief William led up to the lick be took me by purling steams and pleasant places. Our way led through a beaver meadow and that same beaver meadow business is an institution, so to speak, found nowhere so frequently or in such perfection as in the Northern Wilderness. On all the waters of the Moose, wherever you find a small stream emptying into river or lake, you may with something like certainty find a beaver meadow on the course of the brook, usually about midway of the stream. The beaver is the first wild animal of importance to disappear before the white man ibut there are men now living who remember when these beaver meadows were beaver ponds, with busy, sagacious, shy inhabitants. At present they are perfectly level meadows, invariably dotted with graceful, ighing green tunnaracks, with an occasional spruce, standing singly or in groups of three or four, resting in calm quiet in the bright sunlight, searcely moved by the furnous gales that sweep the mountain tops bare of timber. From the very apex of Bald Mountain (the M. St. Louis of Colvin) you look down into one of these onses, a thousand feel below. You could almost throw a stone there, Quiet and motionless it lies, while the signal staff on the summit is bending bonce the gale, and you are fain to keep a fow paces of you off collections of the sending such tops five hundred feed more and send you have a sunder gase tops five hundred feed more and send you have a sunder gase to tops five hundred feed more and send you have a sunder gase to top a five hundred feed more and send you have a sunder gase to top a five hundred feed more and send you have a sunder gase to top a five hundred feed more and send you have a sunder so to the sunder his old coat, and the came and send you have a sunder so to the sunder his old coat, and the came the butt of my rink, sold we have a sunder his old coat, and the came had beyond the perfect of the

reputed to have as much and as accurate knowledge as any man living. At length he tired of stories and talk, drew his blanket about his head, Indian fashion, and subsided in sleep.

"Wake me up early; look after deer," he said the last thing before settling into a steady, subdued snore, that was not at all aggravating.

I sat im late—smoked muscal built floor and living the state of the last thing before and living the state of the last thing the state of the last thing the same living the state of the last thing the same living the sam

was not at all aggravating.

I sat up late—smoked, mused, built fires and listened to my old acquantances, the owls, until, overcome with drowsiness, I, too, pulled my blanket about my cars and slumbered sweetly, after the manner of those who rest a might in open camps.

It was daylight when I awoke. I roused first the fire, and then Chief William. He shook himself together, borrowed my rifle and was off on the trail.

"Fr don't fin' deer, be back in hour," he said, lacon-

cally.
"A fool's errand," said I, and went down to the spring "A fool's errand," said 1, and went down to the spring hole to try lly-lishing. I pooled a couple of half pound-ers, came back to camp, and cooked a trout breakfast in any best manner. William had been gone more than his hour; breakfast was ready and hot, and I was getting im-

patient, when far from beyond the beaver meadow on the mountain came the plain, sharp crack of my rifle. He had found the deer after all. And I ate breakfast alone. It was past 9 A.M. when, getting impatient, I started up the trail, and at the first turn met the Chief, a smile of Christian satisfaction on his face and the limp half of a freshly-killed deer wagging at his hip. It was a bit of good hunter craft. He explained how he had quartered the ground like a setter for a hundred rods before finding blood. Once found he had followed it like a slenth-hound, losing it again on the ridge, and finding the deer at last by patiently quartering the ground again. It was badly wounded in one kidney (all luck), but made a short run and half down again. He crept up within thirty yards and shot it through the head. Few white hunters would ever have tracked out and killed it.

William cocked himself a hearty meal of venison, of which, being well-fed, I could not partake; and then, still insisting on carrying my traps, started to put me, by a short cut on the trail, to my next objective point,

JONES' CAMP.

Albert Jones came into the wilderness about three years ago, so sick and weak as to be lifted from the wagon, and unable to speak aloud on his arrival at the Forge House, foot of the Fulton Chain. He had been a strong man, with an iron constitution, and, like many Americans, had broken himself down by constant overwork and anxiety. He had been a business man; a miner in the early California days; a ranctman; had owned and run sawmills; had been a tame of wild horses among the Spaniards and "buckies" of Mexico, and had spent the best part of an active, vigorous life in the multifarious pursuits, chances and changes peculiar to an adventurous American.

It came to an end by a general physical breakdown. The doctors said "general debility." They always say that when they are stumped. Jones was a native of Northern New York, and in his younger days had often gone to the Wilderness for sport and recreation.

When hand and brain could work no longer he said, "Take me to the woods; if I am to die let me die there." They took him in to die. In less than two months he had so far improved as to go out and attend to business, which had rather piled up on him in his absence. One month of that settled him. He was down again, and again he 'broke his holt' and came to the woods. Again he got the benefit of an open air, care-free life, and when he though himself pretty well able to manage his affairs he went out of the woods and got down to business. And it floored him in just three weeks. Then he let go and came to the Wilderness for good, as he says. He built a confortable log camp (or house) at the foot of the Moose River stillwater, built and bought half a dozen boats, keeps boarders (when they come) at most reasonable rates, and passes his time as quietly as any man I know of. He has regained health and spirits, and would, on the whole, make an excellent subject for "Adirondack Murray," if that gentlement of the floor of the Hoose in the foot of the Sore and the provide of the server of the woods and parameter benefit so

day will leave you in peace. It is in no way filthy, and is not disagreeable to most persons, while the effect is all that can be desired.

#### CAMP CREAM OTARTAR

No MAN'S LAND, dagust, 1880.

BEAR FOREST; —You have, of course, received our invitation to "call and see us." but as you have not put in an appearance I fear the sincerity of the invitation is doubted, "wherein you wrong us deeply," as Hamlet or Ophelia, or some other of Shakespeare's mug-niloquent talkers saith.

I have to report a terrible conflagration and explosion, with no insurance and loss of this. Our sheart resuch

tation is doubted, "wherein you wrong us deeply," as Hamlet or Ophelia, or some other of Slankespeare's magniloquent talkers said.

Thave to report a terrible conflagration and explosion, with no insurance and no loss of life, Our shanty caught fire, or was set on fire, or set fire to itself last night. It was discovered by the socrehing of the Major's left heal, which woke him after some time. The lake was close at hand; the Tin-dipper Company (the Doctor) went actively to work; the Scribe carried water industrionsly for some time in a pail, but afterwards discovered that a large hole had been burned in its bottom, which incapacitated it for retaining anything more fluid than a bickbat; while the Major, with great presence of mind, begat of long experience under fire, kept rapidly filling his mouth with water and spurting it upon the flames. Once, by accident, he got at the wrong tumbler, and cast upon the flery billows a mouthful of old rye. This untoward accident caused the flames to rage more fierely, and then the Doctor's powder-flask blew up.

The scene at this time must be imagined to be appreciated. The lurnd glare cast a crimson tinge upon the water, which dashed apon the beach as if in wild mockery of our misery. The lurid glare also fell upon the dark form of the Scribe, who, having discovered the hole in the pail's botton, was lighting a cigar and cheering on the Fire Department.

As soon as the flames found nothing else to burn they succumbed, and then morning woke and the sun rose, smiling as though one ought to smile back again. Then we found some trout which had been prepared for the morning nead. These we cooked over the embers of our house, and then proceeded to investigate damages.

The Doctor had suffered most. His powder-flask in exploding had blown up his cracker-box cover essay on the "Grasshopper's Hip Complaint in Whortleberry Time," and the world and the London Lurcet loses it forever, It probably saved our lives, however. It lay upon the flask, and the heaviness of the essay, by keepi

but our shelter teuts were saved, so we are comparatively happy.

We have had a great laugh at the Doctor. A country-man, with a face as hard as a billiard ball and about as expressive, told the worthy scientific man a long story about a remarkable dog, which was located on a farm about four miles away. According to the bucolic gentheman this dog was a cross between a bull terrier and a grasshopper. The Doctor went, on a very hot day, to see this pup, and didn't find him. That country gentleman had better not visit our camp again, for the Doctor has prepared a large rock with which to "rock him to sleep" if he reappears.

had better not visit our camp again, for the Doctor has prepared a large rock with which to "rock him to sleep" if he reappears. The country came nigh unto being plunged into mourning last week. Shining lights of the medical, murdering and meditative professions were nearly quenched by the lake's cold waters. The Doctor, the Major, and the Scribe were nearly made food for fishes white fishing for food. It was thus: I was sitting in the stern of the host, the Doctor was in the middle, and the Major in the box. The Doctor and I were using hand-lines and the Major apole. He had his back to us and was afflicted with poor success. Suddenly a very great fish broke waterneur us, "I'll have that fellow," quoth the Major, and so saying he swung his line over his shoulder and caught the Doctor right bang in thenose. "Hello! I'm fast," said the Major, without looking around, and with that he gave a pull, and the Doctor's nose followed the pull, and the Doctor followed his nose."

I was so full of laughter that I couldn't speak, and the sufferer was so surprised that he couldn't; and the Major.

pull, and the Doctor's nose followed the pull, and the Doctor 'followed his nose."

I was so full of laughter that I couldn't speak, and the sufferer was so surprised that he couldn't; and the Major gave another pull, and the Doctor's nose went over the side of the boat, and another pull would have brought him overboard, then the hooked one gave vent to such a horrible sound—a compound of squeal and swear—that the Major paused and look over his shoulder. Then they presented a beautiful tableau. The astonishment and contrition of countenance of one and the furtive clawings of the other at his nose and the horrible mug he presented were indeed rare spectacles; and when I at last recovered from my agony of laughter I was sent back into it again by the lachrymose ejaculation of the sufferer. "How I will look going home to town with a fish hor kin my nose." The Scribe butchered the hook out after his hand had become steady with a penknife. Then the Doctor sat "dipping his beak in the Gascon wine," as Thackeray has it. The Doctor was very soon restored to his usual normal state of cheerfulness and then he passed beyond it; then he undertook to dance a walk round on the gunwale of the boat. Nothing could dissuade inin. Up he got on one side of the frail craft, and in order to counterbalance him we were forced to sit hanging over the other side. Thus some moments passed of violent saltatory movement on his part, and of objurgation on ours. Then the medical gentleman made a misstep and disappeared suddenly into the lake with a wild and cheerful nallo. The boat, relleved from his weight, gave a wallop to port, and in the twinkling of an eye the Scribe and the Major took water railed. Thus some moments passed of violent saltatory movement on his part, and or objurgation on ours. Then the medical gentleman made a misstep and disappeared suddenly into the lake with a wild and cheerful nallo. The boat, relleved from his weight, gave a wallop to port, and in the twinkling of an eye the Scribe and the Major took water solo. Th

—An old angler says that a fish does not suffer much from being hooked. Of course not, It is the thought of how his weight will be lied about that causes him anguish.

—Falconry is being introduced in Boston, and over 200 estimable old hens have met violent deaths while being used by Beacon Hill young ladies in practicing,—Commercial Advertiser,

THE AMERICAN ASSOCIATION MEETING.

THE twenty-ninth annual meeting of the American Association for the Advancement of Science was pargely attended, and in all respects successful. The arrangements of the local committee were excellent, and everything has progressed in a most satisfactory manner.

At 2 o'clock on Tuesday, Aug. 24th, a meeting of the Cambridge Entomological Club was held, at which, after an opening address by Mr. Scudder, its President, were read a number of important papers. Among these was one by Mr. A. R. Grote on the generic characters of the Nocluidæ, one by Prof. A. J. Cook, treating practical apiculture, and one by Rev. H. C. McCook on the honey ants of Colorado. Prof. John L. Leconte read a paper on 'Lightning Bugs," which was of great interest. A number of other contributions of value were read, among thom one by Dr. H. A. Hagen on the Hessian Fly.

The opening exercises of the meeting and the general business having been accomplished during the morning of the 25th, the feature of the day was the address of Prof. Barker, the retiring President, On the Origin of Life, which excited very great interest and was listened to with deep attention. In concluding the speaker said that, physiologically considered, life had now no mysterious passages, no sacred precincts into which the unhallwed fooot of science might not enter, and that research had day by day diminished the phenomena supposed to be vital, and that sooner or later every action of the living body would be pronounced chemical or physical.

The session of the Physical Section, of which Prof. Asaph Hall is President, was interesting, and several astronomical and physical papers of value were read. Section B (Natural History) was addressed by Prof. Alexander Agassiz, its President, who delivered a most learned and suggestive discourse on Biological Development in the Animal Kingdom, as Manifested in the Paleotological and Embryological Study of Sea Urchins. Some of the papers read before this section are as follows: Comparative Anatomy as a Part of the Medical Curriculum, by Dr. Harrison Allen; Distinguishing Species of Populus and Juglans, by Young Naked Branches, by Prof. J. W. Bell; Observations on Japenese Brachiopoda, by Mr. E. S. Morse; Evolution of Parasitic Plants, by Thomas Mechan; On the So-called Fine Blight of the Apple Tree, by Mr. T. J. Burrill. In the sections of Geology, Chemistry and Microscopy important papers were read.

The session of the Permanent Sub-section of Anthro-pology, presided over by Major Powell, was very inter-Prof. A. S. Bickmore's paper upon the Ethnolesting. ogy of Africa was illustrated by a colored map locating many of the races of that continent. Myths and Folklore of the Iroquois, by Erminnie F. Smith, was listened to with close attention, and other papers of interest were

In the afternoon the exercises were not less interesting than in the morning, and in the evening the association listened to an address by Prof. J. Graham Bell, the inventor of the Bell telephone, who discussed the production of sound by light.

The exercises during the remaining days of the week were well attended and of great interest, but lack of space prevents our giving any detailed account of the proceedings. Cincinnati was chosen as the next meeting place. and on Tuesday the following officers were elected President, Prof. Geo. J. Brush, New Haven, Conn.; Secretary, Prof. C. V. Riley, Washington, D. C.; Treasurer, Prof. W. S. Vaux, Philadelphia, Pa. Prof. Alfred M. Mayer, of the Stevens Institute, Hoboken, N. J., was chosen President of Section A.

#### A TRIPARTITE CONTEST.

THE following anecdote comes to us from a thoroughly reliable source, and certainly deserves to be recorded. It is not often that such a combat is witnessed by a man who can give an intelligent and trustworthy account of it :-

nessed by a man who can give an intenigent and trust-worthy account of it:—

On the 24th of July last Mr. Henry Braithwaite, of Frederickton, an experienced hunter, when engaged in exploring timber lands in the interior of Now Brunswick, between the headwaters of the Northwest Miramichi and those of the Tobique, witnessed an unequal contest, such, indeed, as was probably never witnessed by any other person. In his expedition he was accompanied by a well-known helicite Indian, usually called by hunters "Big Louis."

When traveling up the inlet of the Big Southwest Miramichi River, about 5 or 6 o'clock in the afternoon, Mr. Braithwaite heard at a distance of a quarter of a mile a very strauge noise, which he decribes as a combination of growling and bellowing, which increased as he advanced toward it. On turning to Louis and asking his opinion of the cause of this noise, the Indian replied, "Bears fighting."

At the time that Mr. B, heard this noise his small Wesson rife was unloaded, and he had but two cartridges in his pocket, the rest being un his bundle, and not easily reached. Starting with these two, Louis called gently to him, "Take more cartridges in your pocket,"

Mr. Braithwaite replied, "If I stop to get the cartridges the noise may stop, and I may not be able to find the game," and accordincly pushed on with but two cartridges, throwing off at the same time his bundle, expecting Louis to bring it along with his own. He, however, failed to do this, and left both behind, and followed after with but his axe. At a distance of 100 yards, after running a quarter of a mile, Mr. Braithwaite saw the causes of the strange and unwonted sounds.

A huge bear, the largest that he ever saw, and he has seen many, was seated on top of a young moose, upon which he had sprung unawares, breaking his back at the first jump. Whenever the animal attempted to struggle the bear would seize him by the neck and shake him as a dog would a hare. When the moose remained quiet the bear would lick the blood which issued from his wounds. Running up to within twenty yards of the bear, loading in the meantime, Mr. Braithwaite leveled his rifle, and not being able to get a fair view of the bear's head, fired where he supposed the animal's heart to be. The ball passing through him, the latter sprang back off the moose, and staggered and fell, the blood running from both sides. After retreating a few steps he stopped, and looked around to see where the shot came from. Not being able to get a fair view of his head, Mr. B. again fired at the same part of his body, and again struck him. This seemed to give him new energy, and he started off on a run for the stream.

Mr. B. then turned around to the Indian, thinking that he had the bundle with the cartridges, intending to load and follow, but found that he had not brought up the ammunition. There was nothing left but to go back, which Mr. B. did, and reloaded. It took some time to find the bundles, and in the meantime a heavy thunderstorm, accompanied by rain, had set in. They took upthe trail and followed a reasily, guided by the feet marks and blood, for about 200 yards; the woods then getting very open, the rain had washed out the blood and tracks, so that

Kinghirds Catch Fish.—Editor Forest and Stream:—Probably most observing people have noticed with what unerting expertness the kingbird (or bee martin) will catch insects in the air. These birds are very abundant about my premises, nesting in some cases within a few feet of my residence. I never disturb them, believing them not only a valuable insectiverous bird, but having frequent ocular demonstrations of their valuable services in driving off hawks and crows, I have often noticed them striking the surface of the water in my fish ponds, but supposed they were either taking a bath or else catching insects which were flying near the surface of the water. When I constructed my bass pond, a few years ago, I stocked it with minnows to afford ample food for the bass. At times the entire surface of the pond seems alive with them. A few days ago I obseaved at least a half dozen kingbirds perched on trees and bushes near the margin of the pond, and almost every moment some of them would dive into the water precisely like a kingfisher, and I concluded they were catching bugs or other insects which were floating upon the surface of the water. Watching them closely, I, soon saw one of them leave the water with something perceptibly shining in its bill. It alighted on a tree about fifty yards from where I was sitting, and acted precisely as a kingfisher does when killing a tish. Taking a telescope, I also took an observant and the cincles long. I continued my observation and discovered that the kingbird had a minnow not less than three inches long. I continued my observation for about fifteen minutes, and during that time these birds caught several small minnows and ate them. Others more observant may have long known of this trait of the kingbird, but I have never chanced to read or hear of it, and quite likely may be laughed at for my verdancy in reporting what may be well known to every ornithologic amateur.

A Conunprum.—Summerpead, St. Clair County, Ill., KINGBIRDS CATCH FISH.—Editor Forest and Stream:

A CONUNDRUM.—Summerpead, St. Clair County, Ill., Aug. 23d.—In the spring I shot a heron which was carrying in its bill a dead snake about fifteen inches in length. Some five inches of the reptile's tale was drawn through a slit in the lower mandible of the bird, and was held there so firmly, even after the bird was dead, that the snake would have been torn to pieces easier than withdrawn from the bird's bill, How does the bird get the snake there?

G. B. R. S.

We do not get from our correspondent's description any very clear idea of how the snake was attached to the bird's bill. Was the bill split along the side, or did the snake lie between the vami of the mandible and pass through the chin?

through the chin?

Crows as Fruit Thievis.—Etitor Forest and Stream:—I send you the following item from a late paper, and can supplement it with a little experience of ray own:
"Malachi F. Dodge, living near Manchester, N. II., recently saw live large crows descend from a tall pine tree in the Stark woods and alight in a tree laden with ripe Angust apples. Each crow planted its bill firmly into a rosy specimen,, and, detaching it from the stem, flew away with the prize to the pine, where they ate the fruit with evident relish." A short time ago I happened to notice the almost daily visit of a small party of crows to a certain tree in my apple orchard, and it occurred to me that the fruit might be the attraction, as it was a large, tender and sweet variety. A visit to the proved my surmise to he correct. They had destroyed quite a number of apples by pecking out from a quarter to a half. When the stem would give way the apple fell and another would be attacked. This may be nothing new, but in living on a fram constantly visited by crows for nearly thirty years, I have never had occasion to accuse them of this mischief before, though the indictment was strong enough without it. If any of your readers have had a similar experience I hope we shall thear from them. Respectfully yours,

Framingham, Mass., Aug. 25th.

AN UNLUCKY CROW.—Mr. George G. Cole has related to us the following incident, which occurred not long since near Glen's Falls, N. Y.: Mr. H. P. Chimiphey, of that place, being annoyed by large hawks which prey upon his chickens, keeps his shot gun loaded and kills a great many of them. A short time ago a hawk was seen approaching the house, but before the owner could seize his gun the bird had passed out of range and was passing over a piece of woods. Here it was seen to seize a crow, and after coming nearly to the ground to bear it heavily off and alight a short distance further on among some tall weeds. Curiosity prompted Wr. Champney to proceed to the spot, where he found hawk and crow still struggling on the ground, and by a lucky shot killed both of them. The hawk, from the meager description given of it, would appear to have been a young goshawk.

### Hisli Culture.

THE FIRST DECADE OF THE UNITED STATES FISH COMMISSION.

ITS PLAN OF WORK AND ACCOMPLISHED RESULTS, SCIENTIFIC

BY G. BROWN GOODE.

There are nine departments of the government devoted, in part or wholly, to researches in pure and applied science—the Geological Survey; the Coast and Geodetic Survey; the Naval Observatory; the National Museum; the Department of Agriculture; the Entomological Commission; the Tenth Census, with its special agencies for the study of the natural resources of the country; the Smithsonian Bureau of Ethnology, and the Commission of Fish and Fisheries. The Smithsonian Institution, established upon an independent foundation, should also be mentioned, as well as the Medical Museum of the army, and the various laboratories under the control of the Army and Navy Departments.

The Geological Survey is not now carrying on any of the schemes of zoological and botanical investigation engaged in by its predecessors.

The work of the Entomological Commission and that of the census, though of extreme inportance, are lim-

of the census, though of extreme importance, are limited in scope and duration, while that of the Agricultural Department is necessarily, for the most part, eco-

ited in scope and duration, while that of the Agricultural Department is necessarily, for the most part, economical.

The work of the National Museum is chiefly confined to the study of collections made by government surveys or individual collectors and sent in to be reported upon. The work of the Fish Commission, in one of its aspects, may perhaps be regarded as the most prominent of the present efforts of the government in aid of aggressive biological research.

On the 9th of February, 1874, Congress passed a joint resolution which authorized the appointment of a Commissioner of Fish and Fisheries. The duties of the Commissioner were thus defined: "Poprosecute investigations on the subject (of the diminution of valuable fishes) with the view of ascertaining whether any and what distantion in the number of the food-lishes of the coast and the lakes of the United States has taken place; and, if so, to what causes the same is due; and also whether any and what protective, prohibitory or precautionary measures should be adopted in the premises, and to report upon the same to Congress."

The resolution establishing the office of Commissioner of Fisheries required that the person to be appointed should be a civil officer of the Government, of proved scientific and practically limited to a single man for whom, in fact, the office had been created. Prof. Baird, at that time assistant secretary of the Smithsonian Institution, was appointed and entered at once upon his duties.

The summer of 1890 marks the tenth season of ac-

institution, was appointed and entered at once upon his duties.

The summer of 1880 marks the tenth season of active work since its inception in 1871. The Fish Commission now fills a place tentoid more extensive and useful than at first. The present essay aims to show, in a general way, what it has done, is doing and expects to do—its purposes, its methods, its results.

The work is naturally divided into three sections:—

I. The systematic investigation of the waters of the United States and the biological and physical problems which they present. The scientific studies of the Commission are based upon a liberal and philosophical interpretation of the law. In making his original plans the Commissioner insisted that to study only the food-fishes would be of little importance, and that useful conclusions must needs rest upon a broad foundation of investigations purely scientific in character. The life history of species of economic value should be understood from beginning to end, but no less requisite is it to know the histories of the animals and plants upon which they feed or upon which their food is nourished; the histories of their enemies and friends, as well as the currents, temperatures and other physical phenomena of the waters in election to noisor temperatures and other physical phenomena of the waters in election to university in constitution and resolution to not seek that a succession of a constitution of the waters in election to university or reported to the constitution of the waters in election to university or reported to an animal constitution of the waters in election to university.

of their enemies and friends and the friends and loes of their enemies and friends, as well as the currents, temperatures and other physical phenomena of the waters in relation to migration, reproduction and growth. A necessary accompaniment to this division is the amassing of material for research to be stored in the National and other museums for future use.

2 The investigation of the methods of fisheries of past and present, and the statistics of production and commerce of fishery products. Man being one of the chief destroyers of fish, his influence upon their abundance must be studied. Fishery methods and apparatus must be examined and compared with those of other lands, that the use of those which threaten the destruction of medful fishes may be discouraged, and that those which are inefficient may be replaced by others more serviceable. Statistics of industry and trade must be secured for the use of Congress in making treaties or imposing tariffs, to show to producers the best markets, and to consumers where and with what their needs may be supplied.

supplied.

3. The introduction and multiplication of useful food fishes throughout the country, especially in waters under the jurisdiction of the general government, or those common to several States, none of which might feel

\*Read before the American Association for the Advancement of Science, Boston, Aug. 28th, 1880.

willing to make expenditure for the benefit of the others. withing to make expenditure for the benefit of the others. This work, which was not contemplated, when the Commission was established, was first undertaken at the instance of the American Fish Cultural Association, whose representatives induced Congress to make a special appropriation for the purpose. This appropriation has since been renewed every year on a more bountiful scale was designed. propriation for the purpose. This appropriation has since been renewed every year on a more bountiful scale, and propagation is at present by far the most extensive branch of the work of the Commission, both in respect of number of men employed and quantity of money ex-

braich of the work of the Commission, both in respect of number of men employed and quantity of money expended.

Although activity in this direction may be regarded in the light of applied rather than pure scientific work, it is particularly inportant to the biologist, since it affords opportunities for investigating many new problems in physiology and embryology.

The origin of the Commission, its purposes, and methods of organization, having been described, it now remains to review the accomplished results of its work. In many departments, especially that of direct research, most efficient services have been rendered by volunteers; in fact, a large share of what has been accomplished in biological and physical exploration is the result of unpaid labor on the part of some of the most skillful American specialists. Although it would be interesting to review the peculiar features of the work of each investigation, the fionis of this paper will not allow me to do so, or even to mention them all by name.

Since the important fisheries center in New England, the coast of this district has been the seat of the most active operations in marine research. For ten years, the Commissioner, with a party of specialists, has devoted the summer season to work at the shore, at various stations along the coast, from Connecticut to Nova Scotia. A suitable place having been selected, a temporary laboratory is fitted up with the necessary appliances for collection and study: In this are placed from ten to twenty tables, each occupied by an investigator, either an officer of the Commission or a volunteer. From 1878 to 1879, important aid was rendered by the Secretary of the Nawy, who detailed for this service a steamer to be used in dredging and trawling, and this year the steamer built expressly for the Commission is employed in the same manner.\*

The regular routine of operations at a summer station includes all the various forms of activity known to naturalists—collecting along the shore, seining upon the beaches, setting traps for animals not otherwise to be obbeaches, setting traps for animals not otherwise to be ob-tained, and scraping with dredge and trawl the bottom of the sea, at depths as great as can be reached by a steamer in a trip of three days. In the laboratory are carried on the usual structural and systematic studies; the preparation of museum specimens and of reports. Since the organization of the Commission, the deep sea work and the investigation of invertebrate animals has been under the charge of Prof. Verrill, who had for many years before the Commission was established been studyindependently the invertebrate fauna of

been under the charge of Prof. Verril, who had for many years before the Commission was established been studying independently the invertebrate fauna of New England.

In addition to what has been done at the summer station, more or less exhaustive investigations have been carried on by smaller parties on many parts of the coast and interior waters. The fauna of Grand Rapids, and other off-shore fishing grounds, has been partly explored. In 1872, 1873 and 1874 dredging was carried on from the coast survey steamer Bache, by Prof. Packard and Mr. Cooke, Prof. Smith, Mr. Harger and Mr. Rathbun. In 1870 Mr. H. L. Osborne spent three months in a cod schooner ordlecting material on the Grand Banks, and Mr. N. P. Scudder as long a time on the halibut grounds of Davis' Straits.

A most remarkable series of contributions have been received from the fishermen of Cape Ann. When the Fish Commission had its headquarters at Gloucester, in 1878, a general interest in the zoological work sprang up among the crews of the fishing vessels, and since that time they have been vieing with each other in efforts to find new animals. Their activity has been stimulated by the publication of lists of their donations in the local papers, and the number of separate lost of specimens received, to the present time, exceeds eight hundred. Many of these losts are large, consisting of collecting-tanks full of alcoholic specimens. At least thirty fishing vessels now carry collecting-tanks on every trip, and many of the fishermen, with characteristic superstition, have the idea that it insures good luck to have a tank on brand, and will not go to sea without one. The number of specimens acquired in this manner; as at least fifty or sixty thousand, most of them belouging to species unattainable. Each halbut vessels est, twice daily, lines from ten to fourteen miles in length, with hooks upon them six feet agart, in water twelve hundred to eighteen hundred feat in depth, and the quantity of living forms brought up in this manner, and which had neve

No dredging has yet been attempted by the Commission south of Long Island, though much has been done in shore work, especially among the fishes, by special agents and friends of the Commission, and by the parties stationed here and there in the work of fish-culture. Mr. E. G. Blackford, of Fulton Market, New York, by carefully watching the market slabs, has added at least ten species of fishes to the fauna of the United States. Mr. F. Mather is studying the fish of Long Island and the Sound. Dr. Yarrow, Mr. Earll, and others, have collected from Cape May to Key West. The Gulf States' coast was explored last winter by a party conducted by Mr. Silas

1877. Salem Habfax 1878. Gloucester 1879. Provincetown

Stearns, who spent nine months in studying the food-Stearns, who spent nine months in studying the food-and the census. The entire Pacific Coast has been secured by Prof. Jordan for the Commission and the census, and the ichthyology of that region has been enriched by the discovery of sixty species new to the fauna, forty of them being new to iccience. A similar investigation on the great lakes has been carried over a period of several years by Mr. Milner and Mr. Kumlien. The ichthyology of the rivers of the country has received much attention from the many experts employed by the Commission in fish cultural work. fish cultural work

In addition to these local studies may be mentioned

In addition to these local studies may be mentioned the general explorations such as are now being carried on for the cyster, by Mr. Ernest Ingersoll and Mr. John F. Ryder, for the shad by Col. McDonald, for the smelt and the Atlantic salmon by Mr. G. G. Atkins, and the quinnat salmon by Mr. Livingston Stone.

A partial indication of what has been accomplished may be found in the number of species added to the various faunal lists. Take, for instance, the cephalopod mollusks of New England. In Prof. Verrill's recently published monographs twenty species are mentioned, thirteen of which are new to science. Ten years ago only three were known. three were known.

three were known.

I am indebted to Prof. Verrill for the following estimate of the number of species added within the past ten years to the fauna of New England, mainly by the agency of the Commission:—

	Famil	c Known.	Additions.	Now Known
Crustacea		105	193	298
Pycirogonida		5	10	15
Anneiida		67	238	305
Vermes				4.4
Mollusca				
Echinodermata				
Apthozoa				
Furricuta		26	25	51
Volyzoa		56	91	147
Brachtopoda		5	0	5
Sponges		10	80	90
Acalepha				
			* 000	# 000
		008	1,000	1,800
T4 1: 1 : 1 1 1 1 1	43		- C +1	

It is but just to say that many of these species were obtained by Prof. Verrill in the course of his independent explorations in Maine and Connecticut previous to 1871.

A similar estimate for the fishes indicates the discovery

À similar estimate for the fishes indicates the discovery of at least one hundred species on the Eastern Atlantic coast within ten years; half of these are new to science. Forty species have been added to the fauna north of Cape Cod; sixteen of these are new and have been found within three years; seventeen have been described as new from the Gulf of Mexico; sixty, and more, have been added upon the West coast. The results of the summers' campaigns are worked in winter in the Peabody Museum of Yale College, under the direction of Prof. Verrill, and by the specialists of the National Museum.

Seum. One of the important features of the work is the preparation of life histories of the useful marine animals of the country, and great quantities of material have been accumulated relating to almost every species. A portion of this has been published, more or less complete biographical monographs having been printed on the bluefish, the scup, the menhaden, the salmon and the whitefish, and others are nearly ready.

Another monograph which may be referred to in this connection is that of Mr. Starbick on the whale fishery, giving its history from the earliest settlement of North America.

Ancerica.

The temperature of the water in its relation to the movements of fish, has from the first received special attention. Observations are made regularly during the summer work, and at the various hatching stations. At the instance of the Commissioner, an extensive series of observations have for several years been made under the direction of the chief signal officer of the army, at lighthouses, lightships, life-saving and signal stations, carefully chosen, along the whole coast. This year thirty or more fishing schooners and steamers are carrying thermometers to record temperatures upon the fishing grounds, a journal of the movements of the fish being kept at the same time. One practical result of the study of these observations has been the demonstration of the coast of Maine in 1879—a failure on account of which nearly 2,000 persons were thrown out of employment. Another important series of investigations carried on by Commander Beardsley, of the navy, shows the error of the ordinary manner of using the Casel Miller deep seat thermometer; still another series made by Dr. Kidder, of the mavy, and to be carried out in future, had for its object the determination of the temperature of the blood of marine animals.

Observations have also been made by Mr. Milner upon the influence of a change from sea water into fresh water and from fresh water into sea water upon the young of different fishes.

Mr. H. J. Rice carried on series of studies upon the The temperature of the water in its relation

water and from fresh water into sea water upon the young of different fishes.
Mr. H. J. Rice carried on series of studies upon the effect of cold in retarding the development of incubating young

and Prof. Verrill informs me that the number of new and extra limital forms thus placed upon the list of invertes that the number of new and the states amont be less than fifty.

A permanent collector, Mr. Vinal N. Edwards, has been employed at Wood's Holl and vicinity since 1871, and many remarkable forms have also been discovered by him.

No dredging has yet been attempted by the Commission, and by the parties stations out to f Long Island, though much has been done in shore work, especially among the fishes, by special agents and friends of the Commission, and by the parties stationed here and there in the work of fish-culture. Mr. E. G. Blackford, of Fulton Market, New York, by carefully watching the market slabs, has added at least ton species of fishes to the fauna of the United States, Mr. F. Market is studying the fish of Long Island and the Sound. Dr. Yarrow, Mr. Earll, and others, have collected from Cape May to Key West. The Gull State's coast was explored last winter by a party conducted by Mr. Silas 1872. Eastport, 201 by hand, 35 by steamer. 253 1873. Nowled Stolland States and St

propagation work has increased in importance from year to year, as may be seen by the constant increase in the amount of the annual appropriation. A review of the results of the labors of the commission in increasing the food supply of the country, may be found in the annual reports, the rude appliances of fish culture in use ten years ago have given way to scientifically devised apparatus, by which millions of egg are hatched where thousands were, and the demonstration of the possibility of stocking rivers and lakes to any desired extent has been greatly strengthened. This work was for six years most efficiently directed by the late Mr. James W. Milner, and is now in charge of Maj. T. B. Ferguson, also commissioner for the State of Maryland, by whom has been devised the machinery for propagation on a gigantic scale, by the aid of steam, which is now so successfully in use. The investigation of the statistics and history of the fisheries has perhaps assumed greater proportions than was at first contemplated. One of the immediate causes of the establishment of the Commission was the dissension between the line and net fishermen of Southern New England with reference to laws for the protection of the deteriorating fisheries of that region. The first work of Prof. Baird, as Commissioner, was to investigate the causes of this deterioration, and the report of that year's work includes much statistical survey of the great lakes was accomplished, and various circulars were sent out in contemplation of the preparation of monographic reports upon the special branches of the fisheries, some of which have already been published.

In 1877, the Commission, then charged with the settlement of the amount of compensation to be paid by the United States for the privilege of participating in the fisheries of the Provinces. The information at that time available concerning the fisheries was found to be so slight and imperfect that a plan formation at that time available concerning the fisheries was found to be so slight and imper

the Shad Fishery, the Cou Fishery, the Herring Fishery, the Smelt Fishery and various others of less importance.

BISTRIECTION OF ZOÖLOGICAL COLLECTIONS
Hundreds, and even thousands of specimens of a single species are often obtained. After those for the National Museum have been selected, a great number of duplicates remain. These are identified, labeled and made up into sets for exchange with other museums and for distribution to schools and small museums. This is in accordance with the time-honored usage of the Smithsonian Institution, and is regarded as an important branch of the work. Several specialists are employed solely in making up these sets and in gathering material required for their completion. Within three years fifty sets of fishes in alcohol, including at least ten thousand specimens, have been sent out, and fifty sets of invertebrates, embracing one hundred and seventy-five species and two hundred and fifty thousand specimens. One hundred smaller sets of representative forms are intended for educational purposes, to be given to schools and scadenies, are now being prepared.

The arrangement of the invertebrate duplicates is intecharge of Mr. Richard Rathbun; of the fishes, in that of Dr. T. H. Bean.

Feeilbries have also been civen to many institutions for

the charge of Mr. Richard Rathestaller, the charge of Mr. Richard Rathestaller, Tr. H. Bean. Facilities have also been given to many institutions for Facilities have also been given to many institutions for Facilities have also been given to many institutions.

Facilities have also been given to many manufacturions for making collections on their own behalf.

Six annual reports have been published, with an rggregate of 5,65 pages. These cover the period from 1871 to 1878. Many papers relating to the work have been published elsewhere—particularly descriptions of new species and results of special faunal exploration.

AN EPITOME OF THE HISTORY OF THE COMMISSION.

1871.
The Commissioner, with a party of zoölogists, established the first summer station at Wood's Holl, Mass., other assistants being engaged in a similar work at Cape Hatteras and the Great Lakes. He also personally meetigated the alleged decrease of the fisheries in Southern New England, taking the testimony of numerous witnesses.

witnesses.

1873.

This year the summer station was at Eastport, Maine, particular attention being paid to the herring fisheries. The survey of the Great Lakes was continued. Dredging, under the direction of Prof. Packard, was begun on the off-shore banks. At the instance of the American Fish Cultural Association, Congress requested the Commissioner to take charge of the work of multiplying valuable food fishes throughout the country. Work was begun on the shad, salmon and whitelish, and the eggs of the European salmon were imported.

The summer headquarters were fixed at Portland,

The summer headquarters were fixed as rotation, Maine. The opportunities for research were greatly increased by the aid of the Secretary of the Navy, who granted the use of an eighty-ton steamer. Exploration in the outer waters between Mt. Desert and Cape Cod were carried on in the United States Coast Survey steamer Bacho. Operations in fish culture were carried on upon an extensive scale.

1874---1875.

In 1874 the zoölogical work centered at Noank, Conn. The attempt was made to introduce shad into Europe. In 1875 the station was for a second time at Wood's Holl, where a permanent seaside laboratory, with aquarium, was now established. The number of investigations this year was about twenty. The increase in the propagation work was proportionately much larger.

1876.
This year the Commissioner was unable to take the fishes and useful invertebrates in behalf the Commission

field for fishery investigations, having been instructed to exhibit, in connection with the Philadelphia International Exhibition, the methods of fish culture and the American fisheries. Much, however, was accomplished by single investigators in various localities. The propagation work cortinued. This year the first carp were involved from Germany. troduced from Germany.

1877.

The field of investigation was resumed at Salem, Mass., and later at Halifax, N. S. A larger steamer of 300 tons made deep sea research possible. The Commissioner and his staff served as experts before the Halifax Fishery Commission. The propagating work was on the increase, and the government carp ponds were established in and the gov Washington.

#### 1878-1879.

In 1878 the summer station was at Gloucester, Mass.; in 1870 at Provincetown. These centers of the fishing interests were selected that more attention might be devoted to studying the history, statistics and methods of the sea fisheries. A plan for the systematic investigation which seemed yearly more necessary in view of the dissensions between the governments of the United States and Great Britain. In 1879 a combination was formed with the Superintendent of the Tenth Census, by which the Commissioner was enabled to carry more rapidly forward this branch of the work. Specialists were dispatched to all parts of the country to study the biological, statistical and practical aspects of the fisheries. In 1878 the breeding of cod and haddlock was accomplished at Gloucester. In 1879 the propagation of the oyster was accomplished hy cooperation with the Maryland Commission, under the direction of Maj. Ferguson, and the distribution of the carp throughout the country was begun. was begun.

1990

The summer station is at Newport, R. I. The Fish Hawk, a steamer of 484 tons, constructed expressly for the work of the commission, lies at the wharf, now equipped for scientific research, later to be employed in the propagation of sea fish, such as the cod and the mackerel. Over fifty investigations are in the field in the service of the commission. The season was opened by the participation of the commission in the International Exhibition at Berlin. The first homor prize, the gift of the Emperor of Germany, was awarded to Prof. Baird, not alone as an acknowledgement that the display of the United States was the most perfect and most imposing, but as a personal tribute to one who, in the words of the President of the Deutscher Fischerci Verein, is regarded in Europe as the first fish culturalist in the world.

\* In Maine until Sept. 15th.

How BIRDS DESTROY FISH.-We have believed with Prof. Goode that the fishes taken from the sea, by man was but a fraction of what is destroyed by their enemies in the water, as fish, seals, etc., and by the birds. Prof. Goode made this statement in reference to the capture of the menhaden for oil, and its destruction by the hundreds of different kinds of enemies, who number far into the millions of individuals. In speaking of the destruction of herrings by the gannets a recent writer in Nature savs:

says:— Of the five Scotch stations where the gannet breeds, the number of birds frequenting each is put down as follows: Adisa Craig, 12,000; the Base Rock, 12,000; St. Kilda, 50,000; the Btack, 50,000; Gulla Sgeir, 300,000, or a total of-424,000. Each of these birds would consume at least a dozen berrings in the day if it could get them; but estimating the daily average as six to each gannet produces 928,500,000 as the quantity consumed in one year, and reckoning 800 herrings to the barrel gives us 1,160,700 barrels captured by the gannets, as against 759,000 barrels, the total taken by fishermen on the west coast of Scotland for 1872. land for 1872.

Salmon of the Pacific Coast.—Humboldt Harbor, Popoff Island, Shumagins, Alaska Territory, July 19th. Editor Forest and Stream:—In your paper of May 13th I have seen a note by my friend, Prof. Jordan, on the redfish of Idaho, which he thinks is the same as the species figured in Forest and Stream:—N. 18th, 1879, and afterwards received from Capt. Bendire in the U. S. National Museum. I have examined Capt. Bendire's specimens and am prepared to say that they are Kennerly's salmon, Salmo kennerlyi, of Suckley; Oncorhyuchus kennerlyi, of Gill and Jordan. They are not different, except in size from the types of Kennerly's salmon, Now, unless this salmon is identical with the nerka studied by Prof. Jordan, we have no right to call Capt. Bendire's redfish nerka. I have not yet seen a salmon in Alaska which I can positively identify with O. nerka, but

in the systematic work of Gill and Jordan one receives the impression that it is much like quinnat. Kennerly's salmon is not closely like quinnat in some respects; for instance, it has a nucle greater number of teeth in the middle of the roof of the mouth, and its jaws are much

middle of the roof of the mouth, and its jaws are much more oblique.

The name redfish is a source of confusion. In some localities it is safe to assme that the red color of the skin is the foundation for the name. In Cook's Inlet the color of the flesh gives rise to the name, and it is certainly well founded there, the deep red of the drying fish brightening up whole villages in the fishing senson.

I have not seen the Yukon redfish, but there is reason to believe that it is one of the small scaled species.

It was my intention to publish a somewhat extended notice of Capt. Bendire's specimens last spring, but my preparations for collecting in Alaska, and various other duties, prevented me from doing so. Perhaps, after all, it is just as well to let the salmon family rest until we have material enough to enable us to settle on the rightful names and hold to them.

Taktrox H. Beax.

With such investigators as Dr. Bean and Prof. Jordan.

With such investigators as Dr. Bean and Prof. Jordan after them the salmon of the Pacific coast will soon have to give up their family secrets, and allow their relationships to be published to the world. It would be interesting to know the exact time covered by the spawning of each alleged species, as this would show the possibility of some of them being hybrids.

Big Bass in Vermont—Sheldon, Vt., Aug. 16th.—
On the 14th inst., Mr. H. Caseau and myself, with our better halves, and Mr. B. Thomas, visited Bass Lake, or, as it is commonly called, Franklin Pond, where we made a big catch of small-mouthed bass. We used live minnows for bait, and caught the most of our fish between the hours of 6 and 9 a.m. in about fifteen feet of water. I tried fly-fishing, and only took a few small bass in shallow water, which caused me to take to the minnows and deeper water. I selected five of my largest fish and they weighed as follows: 4! bis., 4! bis., 4! bis., 5! bis. and 5ê lbs. My scales were rusty and gave light weights. Friend Caseau followed me closely in size of his fish. We both used Scribner's light greenheart rods. My better half scored next in numbers, leaving Mrs. C.— and Thomas far in the rear. The bass are being well protected here during the close season, which makes this lake the best bass lake in the State, and will afford plenty of sport between now and 1st of November to all "jolly anglers" who may visit its waters.

We would like to see a "small-mouth" of the weights given. We often hear of them, but on examination they

given. We often hear of them, but on examination they have always turned out to be the "big-mouth." If our correspondent is positive as to species, we would advise him to send one to the Smithsonian.

The black basses grow very large in the Southern waters, but we have doubted whetherthe "small-mouth" exceeded four pounds in any Northern State.

exceeded four pounds in any Northern State.

\*\* Bass and Pike-Perch Fishing in the Susquehanna.

—Harrisburg, Aug. 7th.—Having read your valuable paper for some time. I have never seen any notes of fishing on this river. About ten years ago black bass were introduced into this river through the efforts of a few gentlemen of Harrisburg, who worked with perseverance for two or three years, but they at last succeeded in stocking the river so that it is now an easy day's work to catch as high as thirty a day—frequently you hear of catches ranging between forty and sixty. The bait used is toads, minnows, crabs and helgramites. They will also readily take the troll. As for illy-lishing, although very few fish for them that way here, it is exceedingly good, and as many as six or seven can be caught in the evening by fishing in water about three to five feet deep, where there is plenty of eel grass, as the bass lie in this the same as trout in moss. "Salmon" (pike-perch) fishing last fall was better than I have ever known it to be. The bait used is the lamprey eel, trolled along slowly, just fast enough to keep the bait off of the bottom, the catches ranging between twenty and forty a day.

E. H.

Bio Brook-Trout—The Thunder Bay Sentinet (Lake Superior), says: The largest genuine speckled brook trout ever seen in this district was taken in the nets of the Lake Superior Fish Company near Amethyst Bay on Tuesday last; three fish weighed 15 lbs., the largest one rnesday last ; th weighing 64 lbs.

ST. CLAIR FLATS—Mich., Aug. 20th.—The following party are from Frankfort, Ky.: have fished here three days, and caught over two hundred genuine black bass. They will stay until the first of September. This party has the reputation of being the best fishermen in Kentucky; Gen. J. W. Rodman and wife; J. W. Rodman, Jr., and wife; H. W. Rodman; Judge Hines.

New Hampshire—Lake Village, Aug. 16th.—Black bass fishing in the Wakewan Lake, at Meredith, is very fine. On Wednesday I took twenty beauties from the water, nine of them weighing two pounds each. I met a friend who had taken one that afternoon for a solid four pounds—one of the largest of the season.

Gic.

A NEW MAINE SOCIETY .- Monson, Maine, Aug., 9th -A New states Society.—Monsole, making, Ang., we are about organizing an Association here for feetion and stocking our ponds and protection of get Fishing in this vicinity was never better. Ship Pon furnishing a large amount of speckled trout and keeps the state of locked salmon.

New York—Fishkill Landing, Ang. 26th.—The drought has made sad work with the streams that the Wiccapee Association stocked with trout last spring, all the water remaining in them being in the swamps, and that is warm and impure, so the prospects for a good trout fishing next season are anything but encouraging. G.

FLY-FISHING FOR BASS.—On page 69, last issue, line 21 from the bottom, for "a stiff rod is more pliable," etc., read "a stiff rod is more friable," etc.—a typographical error.

### CHICKEN SHOOTING IN AUGUST,

CHICKEN SHOOTING IN AUGUST.

Augus, 1880.

Augus, 1880.

Augus, 1880.

Over a month. Everything is dry and the weather since Aug. 15th has been extremely warm, so that neither man or dog could stand more than one or two hours' hunting in the early morning and late evening. My favorite resort is a two hours' life from Chicago, where I drop down at a farm house the night before I wish to shoot. It is five miles from the near-st railway station, with good shooting in any direction. I am satisfied I go a less distance and fare better then others who go further and perhaps fare worse. The multitude fly to the far off prairies of Nebraska, Minnesota and lova, leaving little oceans of cream within one-hundred miles of Chicago that are seldom skimmed. In this refuge I have bagged forty-eight grouse with a muzzle-loader in a day's shooting, and have never failed to get twenty-five to two guns on the first day's shoot.

Last Monday found me as soon as it was light enough to shoot, tramping a stubble over which, with one exception. I had made an annual parade for the last ten years, My dog was a new acquisition, wonderfully up in the tactics, but lacking the experience of dogs I had hunted over that field in other seasons. I expected surprises in the development of my dog; and what sportsonan does not know when he has a good thing in a dog, even though he has not killed a thousand birds over him? My Knight proved his mettle before we had been afield twenty minutes, and I had the satisfaction of "flashing my first shot" in a prior fine young brid, while the third shot failed to flash and poor Knight seemed to debate in his mind (brain I should say), whether he should not try and catch that single young chick as long as I missed it. A gentle "charge, sir," steadied his nerve, and retrieving the pair we moved on. Most of the morning was taken up trying to cross patent barbed wire fences. Did you ever try to get over, through, under, or on top of one? Like the drouth they prevall in this country, and unless you carry a jumpin

Just let them duils a five strand darboed wire fence, and sportsnen will cross it just as quick as dogs will ent live porcupine.

Knight proved my judgement in his breeding and training to be correct, and he had but one surprise in store for me. One or two in a covery had been flushed when a young chick flushed from under Knight's nose and dropped on the stubble in piani sight, not ten yards from the dog. The chick stepped jauntily along with quick jerks of its tail until Knight became disgusted, and knowing I would not shoot the bird sitting, he made a beautiful dash at it and succeeded in flushing it, and giving it a good start. Visions of check cord, a charge of fine shot, and the whip flashed through my mind, but it was too hot. Giving Knight credit for more sagacity than I supposed he had, as he knew I would not shoot until the bird rose, I sat down and waited his return. He soon came trotting in with a look on his face that told plainly he had not caught that chick. I had a friendly talk with him, took him to where he started, made him charge, and gave him an energetic lecture on the foolishness of chasing: that he would eventually get overtaken with a charge of shot or run into a spiked collar if he ever did it again. During the morning we found four fine coveys, none of the birds full-grown and a few old birds from which I bagged thirteen, at no time being over a mile and a half from the house. The same evening I bagged nine, making twenty-two for the day, and my best day. After the second or third day I became wearied and exhausted with the heat when I returned, determined that the right time to shoot game in this latitude is in the fall, not carlier to soot game in this latitude is in the fall, not carlier to shoot game in this latitude is in the fall, not carlier to shoot game in this latitude is in the fall, not carlier to shoot game in this latitude is in the fall, not carlier the second or the fall of the carmed and exhausted with second or third any Thecame weather and exhausted with the heat when I returned, determined that the right time to shoot game in this latitude is in the fall, not earlier then Sept. 15th, when birds are strong of wing and full in size, and when some pleasure may be had in a day's sport when you can breathe a bracing atmosphere as you walk the gradding studies and the three the ways. walk the crackling stubble and when the game you be will not be unlift for food before it can be trought to rable. Hoping to be able to chronicel the graduation Knight from his October fields with high degree, I

### FIELD SPORTS IN MINNESOTA.

SAUR CENTRE, August, 1880.

SAUK CENTRE. August, 1880.

NE of the most enjoyable pastimes a man can engage in, is in the field with dog and gun. This section of country is well known to a great number of sportsmen who pay yearly visits here in order to find the much sought pinnated grouse (Tetrao capido) and enjoy a week's sport in the fields of Minnesota.

The lawful time for killing this noble bird is Aug. 15th to Oct. 1st, too long a time by half, for they are becoming more scarce every year.

Yesterday, in company with a friend, we took our

breech-loaders and pointer and went out to the stabble fields for a short time, which we describe below. Now our dog is on a "trail," and see how animated he is. "There, look out! he is close upon the game. Now he points; be ready!" cries my companion. The dog still crouches close to the earth with every muscle rigid. I adadvance and urgo him on, but he does not like to go, but now he "creeps" a little closer, when up comes a fine, large bird. Bang! and down he comes. Whirr, whirr, whirr, now follows, and bang! bang! bang! Four birds and not half the covey up yet. Our dog now moves a trifle to the right, and becomes like a statue once more. Now, here comes a stray bird, flying from a field close by where there are three hunters. It is a "cross shot," but it must be made, and I say to my sporting friend, "Will you make it?" "Too far for my gun," he replied; and up mine was brought, and in a much shorter space of fine than it takes to write this I had brought the swift Hyer down at a very long distance, surprising my sport-There bear it takes to write this I had brought the switt Hyer down at a very long distance, surprising my sporting friend not a little. The report of my gun started those that the dog was pointing (three), and on their taking wing were brought to bag like the one previously shot. We are centented with twenty, so we "strike out" for home with the feeling of having had a few hours' pleasant recognition.

recreation.

The following will assist those of our sporting friends The following will assist those of our sporting friends who desire to recreate a few days in Northern Michigan: From St. Paul to Sauk Centre, take the St. Paul, Minne-apolis and Manitoba R. R. Fare will be \$5.50. Board at Sauk Centre House from \$4 to \$5 per week, owing to ac-commodation, etc. Team to drive out in the country. Sank Centre House from \$4 to \$5 per week, owing to ac-commodation, etc. Team to drive out in the country, with a first-class driver who can direct you to some of the best chicken grounds to be found in the Northwest, \$5,50 to \$5 per day. I think this covers all expenses, and can, of course, be increased or diminished at pleasure. Chicken shooting this year is excellent around Sauk Centre, Perhaps it would be more pleasant for Eastern sportsmen to wait until Sept. Ist, when wild fowl are in season. Geese, duck, brant and crane are in large num-lers.

### MORE EVIDENCE AGAINST THE CAT.

" AQUADALE," Wenonah, N. J. Aug. 23d.

MORE EVIDENCE AGAINST THE CAT.

Editor Forest and Stream:—
Your editorial in the issue of Aug. 19th concerning the enemies of our upland birds, touches a point rarely considered by the friends of the birds. The domestic house cat and their vagabond offspring which have no special habitation, are undoubtedly the most destructive enemies with which our gams and small insectivorous birds have to contend. "Aquadale," my little home here containing a few acres only, is richer and more varied in bird life than any similar spot in this latitude with which I am acquainted, and which is surrounded by a dense population. The presence of so many birds is coincident with an almost total absence of cats about the place. Up to the present year we have had a very valuable little English rat-terrier on the place, who has rendered it extremely uncomfortable for all cats which come prowling around the premises. This sagacious little dog early learned the ery of distress which many birds utter when cat, weasel, snake or other enemy comes prowling around, and would frequently go unbidden to their aid. It was interesting to observe the change of note and tone of the birds when they saw the dog approaching, for they had learned that he was their friend. I have seen him class a cat across the field while quite a covey of birds of different varieties would fly close over him uttering notes of cheer. I have seen them in a like manner hover close over him, while he was engaged in killing snakes. Last year, however, a notorious chieken thief in the vicinity killed the dog and the birds at "Aquadale" lost their most active friend, and shot gun all the time. If a strange cat comes around the rifle makes short work with it. If a neighbor's cat pays a visit, a charge of bird-shot at long range suffices to send it home in double time and it rarely pays a second visit. I can most any day find a covey of quail and occasionally a few ruffed grouse within two hundred yardsof my residence, and a greater variety of other birds than I hive ever seen

We have called attention to this abuse of game des troying cats with the sincere hope that our friends may take some active measures, each in his own way, to remedy the evil. Doubtless many of the readers of this letter can recall similar instances from their own ex perience. Those who are fond of the song birds may profitably try the experiment of exterminating the cats for a season. The domestic cat, by reason of its multiplicity, is one of the abominations of the day.

Do IT Now.—New York, Aug. 28th.—Editor Forest and Stream:—Regarding the article entitled "Post the Game Laws on Railroads," I would like to say, that a resolution to that effect was offered by Mr. H. A. Muni, at a meeting of the New York Society for the Protection of Game, some two years ago, but the club for some unknown reason declined to do it. I also tried to get the society to put a stop to the open violation of the game laws by the Long Island Railroad in transporting snared and trapped birds, but without success. This road, or rather the baggage masters on the trains, collect a large number of trapped quait and snared ruffed grouse along the road and self them in the city.

I am in hopes that the new society, mentioned in your paper a few weeks ago, when organized will put a stop to all this poaching business. I hope "A True Lover of the Sport" will send me his address, and join us.

W. HOLBERTON,

MIGRATORY QUAIL RETURNED.—Allentoum, Pa., Au. 27th.—The migratory quail which we let go near Limport, about seven miles from the city, have returned. We did not get a chance to find out whether some h. d returned or not until to-day, when Mr Francis Bitting, a farmer, came to this place and told us that some were breeding near his house and were very tame; he found to the nest about two weeks ago with four eggs, while now it is breeding with a beautiful nest full of fourteen. He has taken special pains to watch them, and gaw that

they make a very poor nest, just about like one made by a chicken in a field. He also saw that every day since he found it, until it began to set, it laid an egg every day. This is the first instance which we know of since we let them  $g_0$ . (C. S. B. we let them go,

ANOTHER WOODCHUCK BLANDERER.—Boston.—Your correspondent's story of Daniel Webster's gray squirrel reminds me of a similar mistake of a couple of my acquaintances. Feeling nunsually warlike one morning, they loaded up the old musket—"45" is the date on it—donned their war paint and with various precautions in the way of chain mail, belmets, scalping knives and squirt guns, wowed vengeance on all that day—prepared for the terrors of the mighty woodchuck. Chapman, as eldest, carried the gun while Bert, as stockholder, held the ammunition. Suddenly the dreaded foe appeared far in the distance along a hedge. But Bert made a miscalculation and the enemy dove into its hole. Much chagrined he walked up to the place and stood on the little mound. Chapman, running along the hedge saw the outline of the "woodchuck" through it and blazed away; necovering from the awful recoil he purst through the hedge, and was astonished to find Bert instead of the woodchuck, specifically over the ground faster on one sound leg thas speeding over the ground faster on one sound leg than Chapman could on his two well ones. All of which ex-emplifies "Puck's" saying, "What fools these mortals be." J. P. True.

LOUISIANA,-We have before now called attention to the attractions of Louisiana for fall and winter shooting. This resume of the game of St. Landry Parish, La., is given in the Opelousas Democrat, whose editor is a sports given in the Opelousas Democrat, whose editor is a sportsman himself: Many portions of St. Landry abound in the finest of game. In the fall and winter, and the early part of spring, ducks and geese are to be found almost everywhere about the ponds and sloughs, which are quite numerous in the prairies. Prairie chickens are pretty abundant some distance west of Opelousas, as also snipe, quait, etc. Bears, turkeys, deer, and all sorts of varmints, roam the dense woods bordering on the Atchafalaya. Calcasicu, Bout, Crocodile, and other streams. Our hunting grounds afford much pleasure and recreation to spottsnen, and not a few of them literally pass the hunting or game season with gun in hand and a brace or two of well-trained pointers or setters at their heels.

The finest kind of fish—trout, bass, white and sun perch, and all other varieties of the finny tribe—can be caught in our larger streams and lakes and lagoons.

mour larger streams and takes and lagoons.

BEAR LAKE SHOOTING CLUB.—Fort Wayne, Ind., Aug. 20th.—The "Bear Lake Shooting Club" of this city have elected the following officers for the ensuing year:— President, Robert Cran. Vice.President, Richard Green; Secretary, George Raymond; Treasurer. Henry Horstmeyer. Regular meetings first Thesday in each month, at which time cach member gives on honor a statement of all game shot during the preceding month, of which a record is kept and read at the annual game supper. One member reports 169 woodcock from July 4th to Ang. 4th, 1889. which is considered very good, as the members are all laboring men, and cannot go when they choose. Forty-seven of said woodcock were bagged in one day. Trap shooting of the club on the second and fourth Fridays in each month. Although 1 am not a member, the boys are all my friends, and hale fellows well met, and strict observers of the law. They report all kinds of game plenty this season. W. D. M.

SOMETHING WRONG WITH THE GAME LAWS .- There is evidently something wrong with the game laws of the State of Louisiana if such an occurrence as the one de tailed below can take place. It should not be lawful anywhere to kill gravid animals, but it is unusual, we think, to find deer carrying young in August. The season opens in Louisiana Aug. 1st, which in our opinion is much The (Opelousas, La.) St. Landry Democrat of

Friday before last Mr. Henderson B. Taylor, living at Barry's Landing, killed a doe which had in her two fawns, one dead and the other alive. The live one he took home and fed, and at last accounts it was living and doing well.

FOLLOW IT UP.—Editor Forest and Stream:—I desire to add my testimony to the statement of the "Poughkeepsie man," in regard to the exorbitant charges at Cobb's Island in times past. If a change has been made for the better as your correspondent "Chasseur" states, well and good. My object in this is to suggest that all spottsmen follow the example of the "Poughkeepsie man," When they meet with extortion make the fact known through Forest and Stieram or some other reliable source. Many look to your journal for information where and how to find sport and health. You do not wish to be a lure for "Itand pirates," so it is to the interest of all to expose and publish extortion wherever met with.

ADBIONDACK.

ADBRONDACK

We hope that our correspondents will follow up this

FISHKILL LANDING, N.Y., Ang. 26th.—There is every indication of good sport with us this fall, Woodcock, quail and ruffed grouse are quite plenty, quail being more abundant than for a number of years before. There has been a good many woodcock killed since Aug. 1st, but I am glad to be able to say that the game laws have been much better observed than usual; even the potential of the property of hunters have acted more like sportsmen than for m

seasons past.

MINNESOTA—Detroit, Aug. 25th.—The hunting season promises to be remarkably good in this locality this fall. Deer are very plentiful. Chickens are beginning to come in from the great prairies out West, and duck will soon migrate from the Northern rice swamps. Immense quantities of fish have been captured here this season. It is estimated that at least 15,000 pounds have been caught since May, with hook and line. Black and Oswego bass have been caught, that weighed six pounds.

HINTSMAN.

CONNECTICUT—Lyme.—Bay snipe shooting has been good here this week. One party killed on Wednesday, Aug. 25th, 129 curlew, dowitchers and large and small yellow-legs. On Thursday the same party killed seventy-four birds, but on Friday not a snipe was to be seen.

Long Island.—The shooting at Montauk has not been good this year, though the Easterly storm of Monday last will probably move the birds. A number of parties have been out, but have not met with much success.

OULEOUT SPORTSMAN'S CLUB.—At a late meeting of the Ouleout Sportsman's Club, of Franklin, N. Y., the following officers were elected for the coming year: President, Dwight Bartlett; Vice-President, M. P. Mc-Koon; Secretary, Eli Howe; Treasurer, E. P. Howe; Executive Committee, Dwight Bartlett, Walter Ruther-ford Walter Hamilton.

Mane Shooting.—Dover, N. H. Aug. 24th.—Have just returned from a day's sport at Well's Beach, Maine. Result: 150 birds of different kinds. Plover, yellow-legs, ring necks and Wilson snipe have just begun to arrive, and in the course of two weeks they will be quite plenty. The above birds are the first that have been bagged this season. As is usual in telling of our exploits in gunning and fishing, I forgot to tell who bagged the most of the game, fully two-thinds. It was that true sportsman, E. H. Whitney, of Cambridgeport, Mass. May be have as good success in all his undertakings as in gunning. W. A. G.

PRAIRIE CHICKENS.—Chicago, Aug. 28d.—On my late shoot in Northern Illinois I found birds plenty, but weather too dry. Large number of sportsmen take our trains weekly for the West. A good share of the chickens sent to this market are unfit for food on arrival, and good ones sell at \$2 per dozen.

J. R. M.

ROBIN SHOOTING IN NEW YORK—Section 13 of the New York game law, as amended in 1880, reads: "No person shall kill or expose for sale, or have in his or her possession after the same has been killed, any robin, meadow lark or starling, save in the months of October, November, or December, under a penalty of rive dollars for each bird so killed, or exposed for sale, or had in

SHOOTING IN MINNESOTA.—A letter dated in campinear Fairmont, Minn. Aug. 21st, gives us the following par-ticulars with regard to the shooting near that town:— There is a good hotel (the Occidental) at Fairmont, plenty There is a good hotel (the Occidental) altriumous project of chickens near by, and a very pleasant country to shoot over. Birds are very abundant, not only chickens, but ducks and ge eee; snipe and plover by the million.

Nedraska.—Platte Centre.—Chickens and quait very plenty, some of them nearly full grown. Sportsmen often make bags of 100 to 150 per day to two guns.

Massachusetts.—Farmers are moving the wild rice on the Agawam shore, regardless of the value of the rice harvest.

EW YORK.—Marbletown, Ang. 13th.—Woodcock bting is a failure in this section this season—no birds, 11, A. M.

—A gentleman writes from Asbury Park, N. J., that he manages to kill from twenty to fifty bay birds al nost every day, and the prospects are that shooting will be better still next week.

#### SHOOTING MATCHES.

CINCINNATI, Aug 21st.—Mutch between the Linclaen Shooting Cub and the Cincinnatus Gun Club. The Cincinnatus Glub; bas been Cath and the Chromastus Guin Clid. The Cinemanus Coupanise as or organized about 6 weeks, and the most of the club never saw a rotary trap fill that day. Weather clear and pleasant; 10 balls each, from Card's rotary trap, 15 yards rise, Bogardus rules:—Cincinnatus Gun Club—Clins, Heafty 10, E. D. Williams 10, F. H. Locke 8, C. A. Smiths, F. L. Nichols 7, James Fish 8, Myron J. Glover, J. N. Warner 7, O. E. Nichols 7, William H. Potter 6 total 78

total 78. Linclaen Shooting Club—H. Mury 10, D.W. Lane 9, Geo. Edwards [8, Lew. Matherson 7, Geo. Coye 9, Con. Sutton 7, B. Davis 7, C. Lansing 5, A. W. Stephens 5, W. Hull 10-total 77. E. D. W.

Winchester, Ky., Aug. 20th.—Score made by the Winchester Gun Club, shooting for a gold medal:—

will have little real effect upon the number of bats infesting the chimneys of that city.

LONG BRANCH GUN CLUB .- On Saturday, Aug. 23th, the members of the Long Branch Gun Club shot at Deal, N.J., for a silver cup presented by the West End Hotel, at Long Branch. The cup was won after some fine shooting by Mr. Polhemus, at 30 yards who shot off a the with Mossrer, W. G. Murphy and Greene, Mr. C. M. Depew made the presentation speech in his usual happy the style. The cup presented to the "very worst shot" was some-thing unique, and was gotten up by Mr. F. H. Stow, of Adams Express. The following is the score and conditions: 10 birds each; entrance fee, \$5; handleap rise, \$9 yards; 5 ground traps. Ties shot off, miss and go out :-

	Yards Rise.	Killed

YONKERS, N. Y., Ang. 21st. - The first field meeting of the Yon-KONKERS, A. 1., And. 288.—The first held meeting of the Yon-kers Gun Club took place on their grounds, Valentine's farm, to-day. The prize for the best shot is a silver medal, to be awarded to the one who makes the largest number of shots during the to the one who makes the argues infinite to tsaots utring the year, in L? monthly competitions. The Hurilagham rules—30 yards rice, with 80 yards boundary—were adopted. The time of shooting was 'hours and 40 minutes. N. B. Valentine acted as referee. Their next practice takes place Tuesday, Sept. 21st. Below is the score of 16 oday's match:

Richard Ward ....01111-5 Jos. Johnstone....111010-4 A pigeon match lor a prize of \$0 took place on the grounds of the Yonkers Gun Club to-day between J. T. Sawyer and A. Aus-tin, the former winning with a score of 15 birds out of 15, to the latter's kout of 15. Time of game, I hour, the Hurlingham rules being strictly followed. J. O'Brien and A. Kolb acted as judges, and E. L. Thomas referee.

and E. L. Thomas referee.

CANTON GUN CLUB.—The Canton, N. Y., Gun Club have engaged Capt. Bogardus to give an exhibition shoot at that place
Sept. 15th; and if the enterprising managers do not have
the whole of St. Lawrence County present upon that occasion it
will certainly not be the fault of the very ingenious circular which announces the event

which announces the event.

Booxros, Atty. 30th.—The following private shoot took place
Saturday, Aug. 28th. at Ball's Crossing; 20 pigeons (wild); 23
yards rise; both barrels; E. B. Dawson 12, D. B. Fuller 17, Frank
Jonkins 9 Mr. Dawson shota flight 12 bore Daly gun, Mr. Fuller
a light 12 bore Scott, and Mr. Jenkins a light 12 bore Daly un. the list time Mr. Jenkins shot at pigeous, which explains how score.

A PASTOR MADE HAPPY .- I have been greatly troubled with my kidneys and liver for over twenty years, and during that en-tire time I was never free from pain. My medical bills were cone-mous, and I visited belt in the Ito and White Springs, noted for the curative qualities of the water. I am happy to say I am now a well man, and entirely as the result of Warner's Safe Kidney and well man, and entirely as the result of warner's Safe avoney and Liver Cure. Not only this, but my little daughter has been cured of St. Vitus' Dance by Warner's Safe Nervine, which I always keep in my family. With such glorious results, I am only too glad to testify regarding the remedies which have made me so happy.

#### PENNSYLVANIA STATE FIELD TRIALS.

Lancaster, Pa., Aug. 28th.

LANCASTER, Pa., Jug. 28th.

Editor Porest and Stream:—

The sportsmen of this city and county are anticipating with much pleasure the meeting of the State Field Trial Association, which takes place in this city Nov. 9th. The ground selected for the trials is several miles from this city and is highly suitable for the purpose. It is accessible by railroad, and comprises some of the richest land in the county, while it affords ample cover for the birds, which promise this year to be unusally plentiful. Our game protective association has interested itself in the matter, and all the indications point to a highly successful meeting. May the best dog win. A few days since we were invited by Mr. Geo. Pownall of Christiana, this county, to visit his kennels and see his beagle puppies, now about four months old. Twenty-one of the little beauties were enough to gladden the heart of any sportsman. Of fine form, beautiful markings, and lirely dispositions, they were the ideal of what beagles should be. Had our purses been very plethoric we would have bought the entire lot and run them as a pack, but as it is, we modestly contented ourselves with a pair. With these we hope, on some crisp October or November morning, to waken the hills of the Octoraro with music, doubly delightful to the ear of the ardent sportsman.

CNDSTOGA.

We have heard Mr. Pownall's kennel highly spoken of.

PLAIN WORDS ABOUT DOG MURDERERS.

NORTH ANDOVER, Mass., Aug. 16th.

Editor Forest and Stream:—

The black English setter advertised for sale in your piper by E. Elwell, being dead, you will oblige me by stating that fact in the columns of your valued journal, which will explain to numerous correspondents, who still continue to telegraph and write from all parts of the country, the reason why they get no answers to their questions and generous offers. I commenced to answer them by mail, but they are coming in so thick and fast that I must appeal to you to say dead dog for me. It seems that a venomous sneak is the owner or possessor of a miserable pot metal gun, with which he has been ruthlessly shooting any and every kind of bird which fernal blunderbuss. When a bird lights, if no one is fernal blunderbuss. When a bird lights, if no one is fernal blunderbuss. When a bird lights, if no one is the state of the state o

rible manner. In this condition the poor dog crawled home, and who can imagine the feelings of his master as he brought out the gun, the very sight of which in days gone by set the noble animal bounding with joy, to end by a well directed aim his terrible sufferings? Or who can imagine a being of man's image, so despicable as to commit such a diabolical outrage? The dog was well known as remarkably intelligent, well trained, and perfectly peaceable, never known to do injury to any person or thing, and he was advertised for sale to make rrom for a high bred Gordon bitch, from the well-known kendel of Mr. E. C. Alden, Dedham, Mass., which name is sufficient guarantee for a strictly first-class dog, as everyone who has been fortunate enough to obtain a dog from him will testify. His method of breeding has been learned by careful study and long experience, and in breaking, the same experience and observation as a thorough sportsman and gentleman enable him to know what is required of a dog, and just how to breed and train to meet those requirements. With thanks for all would-be purchasers, and hopes of better success in the future, I beg to subscribe myself a friend to all true sportsmen.

G. W. E. rible manner. In this condition the poor dog crawled home, and who can imagine the feelings of his master as

ENGLISHE DOGGES\*

The fourth Section of this discourse.

Dogges of a Course Kind seruing for many Necessary uses, called in Latine Canes Rustici, and first of the

shepherds dogge, called in Latine Canis Pastoralis,

called in Latine Cawes Rushic, and first of the shepherds dogge, called in Latine Cannis Pastoralis.

Dozges of The shepherds dogge! These two are the courser The mastlue or the principal The first kinde, manchy the shepherds hounde is very necessary and profitable for the anothing of harmes and inconueniences which may come to mon by the means of beastes. The second sort serue to succour against the snarves and attemptes of mischiefous men. Our shepherds slogge is not huge, vaste, and bigge, but of an indifferent stature and growth, because it hath not to deale with the bloudthyrsty wolf, sythence there he none in England, which happy and nortunate benefite is to be ascribed to the puisaunt Frince Eigar, who to thintent y' the whole countrey myght be enacuated and quite clered from wolfes, charged & commanded the welsheme (who were pestered with these butcherly beastes aboue measure) to paye him yearely tribute which was (note the wisedome of the King) three hundred wolfes. Some there be which write that Luctual Prince of Wales paide yearly to King Edgar three hundred wolfes. Some there be which write that Luctual Prince of Wales paide yearly to King Edgar three hundred wolfes. In the name of an exaction (as we hane sayd before.) And that by the meanes hereof, within in the compasse and tearme of foure yeares none of those noysome, and pestilent Beastes were left in the coastes of England and Wales. This Edgar were the Crown royall, and bare the Scepter imperial of this kingdome, about the yeers of our Lorde nyne hundred fifty, nyne. Synce which time we reede that no Wolfe hath bene seene in England, bred within the bounds and borders of this country, mary there have bene diuers brought ouer from beyonde the seas, for greedynesse of gaine and to make money, for gasing and gaping, staring, and standing to see them, being a straunge beast, rare, and seldom scene in England, But to returne to our shepherds dogge. This dogge either at the hearing of his masters voice, or at the wagging and whisteling in his fist, Of the mastine or Bandogge called in Latine

Of the mastine or Bandogge called in Latine Villations or Cathenarius.

This kinde of Dogge called a mastyne or Bandogge is vaste, lunge, stubborne, ougly, and enger, of a heuy and burthenous body, and therefore but of litle swiftnesse, terrible, and frightfull to beholde, and are more fearce and fell then any Arcadian curre (notwithstading they are sayd to hane their generation of the violent Lion.) They are called Villatia, because they are appointed to watche and keeps farme places and contry cotages sequestred from commo recourse, and not abutting ypon other houses by reason of distance, when there is any feare conceaued of theefes, robbers, spoyler, and night wanderers. They are seruiceable against the Foxe and the Badgar, to drive wilde and tame swyne out of Medowes, pastures, glebelandes and places planted with fruite, to bayte and take the bull by the eare, when occasion so requireth. One dogge or two at the vitermost, sufficient for that purpose be the bull neuer so monstrous, neuer so fearce, neuer so furious, neuer so steame, neuer so violent and valiaunt, striking could feare into the harts of men, but standing in feare of no man, in so much that no weapons will make him shrincke,

\*Of Englishe Dogges, the dimersities, the names, the natures.

\*Of Englishe Dogges, | the diversities, the names, | the natures of the properties. | A Short | Treatise written in latine | by Jonannes Cause of late memo | me, Doctor of Phisticke | in the University | of Cambridge | And | Doctor of Phisticke | in the University | of Cambridge | And | And | On the Philipse | On the Philipse | Ones, and are to be | solde over against S. Sepul- | chre's Church (though I) | Newgate | 1576.

nor abridge his boldnes. Our English men (to th' intent that theyr dogges might be the more fell and fearce) assist nature with arte, vse, and custome, for they teach theyr dogges to baite the Beare, to baite the Ball and obter such like cruell and bloudly beastes (appointing an ouerseer of the game) without any collar to defend theyr throtes, and oftentines they traine them vp in fighting and wrestling with a man hauing for the safegarde of his lyfe, eyther a Pikestaffe, a clubbe, or a sworde and by vsing them to such exercises as these, theyr dogges become more sturdy and strong. The force which is in them surmounteth all beleefe, the fast holde which they take with their teeth exceedeth all credit, three of them against a Beare, fowre against a Lyon are sufficient, both to try masteryes with them and vtterly to ouermarch them. Which Henry the seventh of that name, King of England (a Prince both politique & warlike) perceauing on a certaine time (as the report runneth) commaunded all such dogges (how many soeuer they were in number) should be hanged, beying deepely displeased, and conceauing great disdaine that an yil faured rascall curreshould with such violent villany, assault the valiannt Lyon king of all beastes. An example for all subjects worthy remembraunce, to admonishe them that it is no advantage to them to rebell against y' regiment of their ruler, but to keepe them within the limits of Loyaltie. worthy remembraunce, to admonishe then that it is no aduantage to them to rebel against y' regiment of their ruler, but to keepe them within the limits of Loyaltie, I reede an history aunswerable to this of the selfe same Henry, who hauing a notable and an excellent fayre Falcon, it fortuned that the kings Falconers, in the presence and heating of his grace, lighly commended his Maiesties Falcon, saying that is feared not to intermeddle with an Eagle, it was so venturous a byrde and so myghty, which when the King harde, he charged that the Falcon should be killed without delay, for the selfe same reason (as it may seeme) which was rehersed in the occlusion of the former history concerning the same king. This dogge is called, in like maner, Carthenarius, a Cathena, of the chaine wherewith he is tyed at the gates, in y' daytime, least beyng lose he should doe much mischiefe and yet might gine occasion of feare and terror by his bigge barcking. And albeit Cicero in his oration had Pro. S. Ross, be of this opinion, that such Dogges as barcke in the broade day light shoulde haue their legges broken, yet our countrymen, on this side of the seas for heir carelessness of lyfe setting all at cinque and sice, are of a contrary indgment. For theefes roge y and down in enery corner, no place is free from them, no not y' prince's pallace, nor the country mans cotage. In the day time they practise pilfering, picking, open robbing, and priny stealing, and what legerdemaine lacke they; not fearing the shamefull and horrible death of hanging. The cause of which inconuenience doth not onely issue from nipping neede & wringing want, for all y' steale, are not pinched with powerty, but som steale to maintaine their excessive and prodigall expences in apparell, their lewdness of lyfe, their haulines of hart, theyr wantomes of maners, theyr wilfull yddenes, their ambitious brauery, and the pryde of the sawey Salacones' megulor-rowlow vaine golroius and arrogant in behautor, whose delight dependent wholly to mount nimbly on horseback aduantage to them to rebell against y' regiment of their ruler, but to keepe them within the limits of Loyaltie.

### Of the latinists Canis Cultos, in Englishe

the Dogge keeper. Borrowing his name of his service, for he doth not onely keepe farmers houses, but also merchaunts mai onely keepe farmers nouses, out also merchaunts maisons, wherin great wealth, riches, substaunce and costly stuffe is reposed. And therfore were certain dogges founde and maintained at the common costes and charges of the Citizens of Rome in the place called Capitolium, to give warning of theefes comming. This kind of dogge is also called.

#### In latine Canis Lantarius in Englishe the Butchers Dogge

So called for the necessity of his vse, for his seruice af-foordeth great benefite to the Butcher as well in following as in taking his cattell when neede constraineth, vrgeth, and requireth. This kinde of dogge is likewise called,

In latine Molossercus or Molossus.

After the name of a countrey in Epirus called Molossia, which harboureth many stoute, stronge, and sturdy Dogges of this sort, for the dogges of that countrey are good in deede, or else there is no trust to be had in the testimonic of writers. This dogge is also called,

### In latine Canis Mandatarius a Dogge messin-

ger or Carrier.

Upon substanciall consideration, because at his masters voyce and commandment, he carrieth letters from place to place, wrapped vp cunningly in his lether collar, fastened thereto, or sowed close therin, who, least be should be hindered in his passage vest these helpes very skilfully, namely resistance in fighting if he be not ouer-

matched, or else swiftnesse & readinesse in running away, if he be vnable to buckle with the dogge that would faine have a snatch at his skinne. This kinde of dogge is also called,

### In latine Canis Lunarius, in Englishe

the Mooner.

Because he doth nothing else but watch and warde at an ynche, wasting the wearisome night season without slombering or sleeping, bawing & wawing at the Moone (that I may vse the word of Nonius) a qualitie in mine opinion straunge to consider. This kinde of dogge is also called,

In latine Aquarius in Englishe a water drawer, And these be of the greater and the waighter sort drawing water out of wells and deepe pittes, by a wheele which they turne rounde about by the mouing of their burthenous bodies. This kinde of dogge is called in like

#### Canis Sarcinarius in Latine, and may aptly be englished a Tynkers Curre.

lished a Tynkers Curre.

Because with marueilous pacience they beare bigge budgettes fraught with Tinckers tooles and mettall meete to mend kettles, porrige pottes, skellets, and chafers, and other such like trumpery requisite for their occupacion and loytering trade, easing him of a great burthen which otherwise he himselfe should carry ypon his shoulders, which condition hath challenged vnto them the foresaid name. Besides the qualities which we hane already recounted, this kind of dogges hath this principall propertie ingratted in them, that they loue their masters liberally, and hate strangers despightfully, whereypon it followeth that they are to their masters, in traueiling a singular safgard, defending them forceably, from the inuasion of villons and theefes, prescring their lyfes from losse, and their health from hassard, they fleshe from hacking and hewing with such like desperate daungers. For which consideration they are meritoriously tearmed. desperate daungers. F meritoriously tearmed,

### In Latine Canes defensores defending dogges

in our mother toungue.

If it chaunce that the master bee oppressed, either by a multitude, or by the greater violence & so be beaten downe that he lye groueling on the grounde, (it is proued true by experience) that this Dogge forsaketh not his master, no not when he is starcke deade: But induring the force of famishment and the outrageous tempestes of the weather, most vigilantly watcheth and carefully keepeth the deade carkasse many dayes, endenouring, furthermore, to kil the murtherer of his master, if he may get any advantage. Or else by barcking, by howling, by furious iarring, snarring, and such like meanns betrayeth the melefactour as desirous to have the death of his aforesayde Master riggrouslye revenged. And example hereof fortuned within the compasse of my memory. The Dogge of a certaine wayefaring man trauailing ample hereof fortuned within the compasse of my meniory. The Dogge of a certaine wayefaring man transiling from the Citie of London directly to the Towne of Kingstone (most famous and renowned by reason of the triumphant coronation of eight seureal Kings) passing oner a good portion of his iourney was assaulted and set vpon by certaine confederate theefes laying in waight for the spoyle in \*Comeparche\*, a perillous bottom, compassed about wyth woddes to well knowne for the manyfolde murders & mischiefeous robberies theyr committed. Into whose handes this passinger chaunced to fall, so that his ill lucke cost him the price of his lyfe. And that Dogge whose seyer was Englishe (which \*Blondus registreth to hane bene within the banckes of his remebrance) manifestly perceauyng that his Master was murthered (this chaunced not farre from \*Paris\*, by the handes of one which was a suiter to the same woma, whom he was a wooer unto, dyd both bewrape the blondy butcher, and attempted to teare out the villous throate if he had not sought meanes to suoyde the reusenging rage of the Dogge. In fyers also to moyde the reuenging rage of the Dogge. In fyers also which fortune in the silence and dead time of the night, or in stormy weather of the sayde season, the older dogges barcke, ball, howle, and yell (yea notwithstandyng they bee roughly rated) neyther will they stay their tounges till the households servauntes awake, ryse, search, and see the burning of the fyre, which beyng perceaued they ves voluntary silence, and cease from yolping. This hath bene, and is founde true by tryall, in sundry partes of England. There was no faynting faith in that Dogge, which when his Master by a mischaunce in hunting stumbled and fell toppling downe a deepe dytche beyng rabele to recouer of himselfe, the Dogge signifying his masters mishappe, reskue came, and he was hayled up by a rope, whom the Dogge seeying almost drawne up to the edge of the dytche, cheerfully saluted, leaping and skipping yoon his masters as though he woulde haue imbraced hym, beyng glad of his presence, whose longer absence he was lothe to lacke. Some Dogges there be, which will not suffer fiery coales to lye skattered about the hearthe, but with their pawes wil rake up the burnyng coales, musying and studying fyrst with themselues how it might be conueniently be done. And if so bee that the coales caste to great a heate then will they bury them in ashes and so remoue them forwarde to a fyt olace with their noses. Other Douges here they which to anoyde the renenging rage of the Dogge. In fyersals which fortune in the silence and dead time of the night them in ashes and so remoue them forwarde to a fy place with theyr noses. Other Dorges bee there white exequite the office of a Farmer in the nyghte tyme. Fe when his master goeth to bedde to take his natura sleepe, And when

## A hundred barres of brasse an yron boltes, Make all things safe from startes and from reuoltes. VY hen Ianus keepes the gate with Argos eye, That daungers none approch, ne mischiefes nye.

As Virgill vaunteth in his verses, Then if his master byddeth him go abroade, he lingereth not, but raungeth ouerall his lande lying there about, more diligently, I wys, then any farmer himselfe. And if he find anything their that is straunge and pertaining to other persons besides his master, whether it be man, woman, or beast, he driueth them out of the ground, not meddling with any thing which doth belong to the possession and was of his master. But how much faythfulness, so much diursitie there is in their natures,

Which barcke only with free and open throate but will not bite, be some Which due both barcke and byte, Which bite bitterly before they barcke,

The first are not greatly to be feared, because they themselues are fearefull, and fearefull dogges (as the prouerbe importeth) barcke most vehemently.

The second are daungerous, it is wisedome to take

heede of them because they sounde, as it were, an Alarum of an afterclappe, and these dogges must not be oner much moued or promoked, for then they take on outragiously as if they were madde, watching to set the print of their teeth in the fleshe. And these kinde of dogges are fearce and cager by nature.

The thirde are deadly, for they flye upon a man, without viteraunce of voyce, snatch at him, and catche him by the throate, and most cruelly byte out colloppes of fleashe. Fearc these kind of Curres (if thou bee wise and circumspect about thine owne safetie) for they be stoute and stubborne dogges, and set vpon a man at a sodden vnwares. By these signes and tokens, by these notes and argumentes our men discerne the cowardly curre from the couragious dogge the bolde from the fearefull, the butcherly from the gentle and tractable. Moreoner they coniecture that a whelpe of any ll kinde is not worthe the keeping and that no dogge can serue the sundry vses of men so apity and so conueniently as this sort of whom we have so largely written already. For if any be disposed to drawe the aboue named services into a table, what ma more clearly, and with more volumency of voyce giveth warning cyther of a wasteful beaste, or of a spoiling theefe than this? who by his barcking (as good as a burning beacon) foreshoweth hassards at hand? What maner of beast stronger? what sermant to his master more louing? what companion more trustic? what watchman more vigilant? what renenger more constant? what measinger more specific? what water bearer more painefull? Finally what packhorse more patient? And thus much concerning English Dogges, first of the gentle kinde, secondly of the courser kinde. Nowe it remaineth that we deliuer vnto you the Dogges of a mungrell or a currishe kinde, and then wil wee performe our taske.

#### EASTERN FIELD TRIALS.

REGULATIONS, RULES FOR RUNNING, AND INSTRUCTIONS TO JUDGES—TRIALS, 1880.

Rule 1. The Executive Board shall advertise the fime and place where the meeting will be held, the date of closing entries, the scale of points, and the names of judges, at least thirty days before the trials take place, In the event any judge or judges fail to act, the competitors shall fill all vacancies, each competitor being entitled

In the event any judge or judges fail to act, the competitors shall fill all vacancies, each competitor being entitled to one vote.

Rule 2. "Dogs shall be drawn in braces by lot and run in heats, the beaten dogs to be retired (except as herein-after/mentioned), and the winners to be run again in the order in which they run their successive heats. If there should be a bye, the dog getting the benefit of the bye shall be run in the first heat of the next series of heats. If two dogs, owned, or exhibited by the same person, should be drawn to run together or come together in any successive heat, the second dog shall change place with the next dog in the order of running. This shall be continued until only two dogs remain, and the winner of theses two shall be the winner of the first prize. The last dog beaten by the winner of the first prize. The winner of this heat shall compete for the second prize with the best of those previously beaten by the scond prize winner, and the winner shall be third in the race. The discretion is given the judges of deciding which is the best of these beaten dogs in the competition for second and third places, by selection, or by running extra heats between them.

Rule 3. When two dogs owned or trained by the same

best of these bearen togs in the competition for second and third places, by selection, or by running extra heats between them.

Rule 3. When two dogs owned or trained by the same person shall be drawn together, one shall be run only, and he with another dog, which shall be immediately drawn, and the dog left over shall be drawn again. If at the latter end of a trial it be found impossible to avoid running two such dogs together, it may be permitted. Rule 4. The judges shall order up the dogs as soon as they have determined which is the best, according to the scale of points in Rule 5. But, unless any dog shows such lack of merit that, in the opinion of the judges, he cannot be placed, all dogs shall, if time permits, have at least three chances to show their behavior on birds.

Rule 5. Positive points for merit: Pointing, 35; pace, 15; backling, 8; style, 7; stanchness, s; ranging and quartering, 10; obedience and disposition, 7; retrieving, 10; total 100. Negative points of demerit: False pointing, 1 to 7; breaking in, 3, each offense; breaking shot, 5, each offense; chassing or breaking shot and chasing, 10, first offense; escond, out of the race.

Rule 6. No person, except the judges, attendants and reporters will be permitted to accompany the handlers of dogs. Two persons will not be permitted to work one dog or a brace of dogs. If from any cause the handler of a dog or brace of dogs is disable do such extent that he cannot shoot, the judges shall appoint a person to shoot for him. The handlers of the two dogs shall go together as if it were a brace of dogs, so that the dogs shall be upon an equality as to ground, opportunities for pointing, etc. No spectators will be allowed nearer the handler of dogs than seventy-live yards to the rear. No person shall make any remark about the judges or dogs in heartn of the judges; such person so offending shall be expedied from the grounds. Should any handler of dogs annoy make any remark about the judges or dogs in hearin of the judges; such person so offending shall be expelled from the grounds. Should any handler of dogs annoy the judges after having been ordered to desist, the judges shall order such dogs as he is handling up and out of the race. The privilege is granted the handlers to ask the judges for information or explanation that has a direct bearing upon any point at issue; pending such question the dogs shall not be under judgment. Dogs afflicted with any contagious disease, or bitches in season, will not be permitted on the grounds.

Rule 7. Pointing hares, "stink birds," larks, turtles, bittern, or any bird generally considered game, shall not be deemed false points. A dog making a false point, and discovering it to be such, without any encouragement from his handler, shall not be penalized.

INSTRUCTIONS TO JUDGES

Pointing.—The judges will allow only those dogs the maximum that point all the birds possible for them to point under existing circumstances; a dog to earn the maximum number of points under this head must display a first-class nose and exhibit great judgment in finding and pointing his birds, and make no flushes that play a first-class nose and exhibit great judgment in finding and pointing his birds, and make no flushes that a dog with the above qualities would avoid in ordinary hunting. The dogs are to be hunted in all respects as in an ordinary day's shooting, in a sportsman-like manner, Inexcusable or wilful flushes will detract from a dog's score under this head, but the character of the flush must be always taken into account in estimating the penalty, if any. The judges nust not ask the handlers if their dogs are pointing, but must decide for themselves. They shall always consider the nature of the ground, the wind and the birds, and not penaltize a dog for flushing a bird it would be impossible to point. The penalty for flushes to be graded by the character of the offense. The judges shall not require the handlers to work their dogs down wind. wind

and.

Pare.—The dog that maintains the fastest gait through out the trial, except when in cover or on game, to receive the full number of points, all others to be graded by

him. Backing.—The maximum only allowed such dogs as stand or drop instantly at sight of another dog pointing. But no dog shall be expected to back unless the dog pointing, stands and is motionless. A dog shall not be said to refuse to back unless he sees the dog pointing stands and is motionless. A dog shall not be said to refuse to back unless he sees the dog pointing. To get credit for a back, the dog must stop at least ten yards (when practicable) in front of the handler. Should a dog refuse to back, and, instead, go ahead, or alongside of the pointing dog, and stead a point, the same shall not again be allowed to come nearer his pointing competitor than twenty yards, and be kept charged while the birds are being flushed over the pointing dog.

Style.—The judges shall consider the dog's grace in ranging and drawing, and attitudes in pointing and backing.

Style.—The judges smar consists of pointing and backing.

and drawing, and attitudes in pointing and backing.

Stanchness.—The maximum allowed such dogs only as do not advance from their point when they are on game until ordered on.

Runging and Quartering.—The maximum only allowed the dogs that maintain the most killing range throughout, viz.; wide or close, as the necessity of the case may require, and who cover their ground systematically excepting where the nature of the ground renders such work impracticable.

Obedience and Disposition.—The maximum only allowed to a dog that works promptly to the gun without noise or severity, and is obedient, prompt, cheerful and easily handled.

Retrieving.—To receive the maximum under this head, a dog shall go promptly and cheerfully for the bird, find the same, and deliver it to the handler without mouthing or mutilation. The handler shall not assist the dog in finding the dead bird by leading the same toward it, excepting where circumstances are such that the dog cannot reasonably be expected to find the bird, or not without much loss of time.

False Pointing.—The judges shall give a dog ample opnot reasonably out much loss (

out much loss of time.

False Pointing.—The judges shall give a dog ample opportunity to discover whether or not he is on a true point, and the penalty shall range from 1 to 7 for his acts throughout the heat.

Breaking in is when a dog through imperfect breaking of from reaction with the loss.

Breaking in is when a dog through imperfect breaking or from excitement, leaves his position when the birds rise, whether the gun is fired or not, and starts to break shot or chase, but stops within a few feet from the point from which he started, of his accord or by command. Breaking shot is when a dog runs in when a shot is fited, with the intention of getting the bird. Chasing is when a dog follows the birds, either when the gun is fired or not, to an extent to be beyond the control of the handler for the rime being. Puppy Stakes.—Rule is Dogs over eighteen months old shall not be eligible for the Puppy Stakes. Rule as above.

Brace Stakes.—The rules governing the Brace Stakes

Brace Stakes.—The rules governing the Brace Stakes shall be the same as those used in the All-Aged Stakes, with the following exceptions: The maximum for ranging and quartering shall be 20 instead of 10, and the total one hundred and ten instead of one hundred. The brace to earn the maximum for quartering must cross each other systematically, and work independent of each other, come dow, must quarter the ground on one side of the or one dog must quarter the ground on one side of the handler while the other dog quarters the opposite side, the handler white the other dog quarters the opposite side, the dogs meeting at or near the center. Each brace will be run separately, instead of running in heats, and be judged by the scale of points as laid down and explained.

Nursery Stakes.—Rule: Dogs over twelve months old shall not be eligible for Nursery Stakes, There will be no points allowed for retrieving in this stake. Rules otherwise as above.

#### THE FIELD TRIAL RULES DISCUSSED.

THE FIELD TRIAL RULES DISCUSSED.

New YORK, Ang. 30th.

Editor Forest and Stream:—

The rules which are to govern N. A. K. C. Field Trials, which have appeared in the Forkers AND Stream, and those of the Eastern Field Trial Club, just issued, call for some notice and even criticism on the part of those who, whether as competitors in the trials, or merely as practical sportsmen and owners or breeders of dogs, are interested in the improvement of the field dogs of America. No one can take part in, or even witness, such contests as the field trials to be run next fall without feeling a deep interest in their success; for it is acknowledged by all practical shooting men, that such trials contribute more to raise the standard of excellence of our setters and pointers than anything else can. Bench shows are, of course, very well in their way, and a prize winner is a beautiful object to the eye, but many a dog that has taken a blue ribbon would not be worth, to the sportsman, the charge of powder and lead that would blov out his brains, while some animal at which the judges disdain to cast a second glance, may do his work in the field, day after day, in a style that would satisfy the most exacting lover of the gun. For myself, while I yield to

no one in my admiration of a beautiful animal, as near the type of his kind as may be, I would rather do my shooting over a pig, if it was well broken, fast and had a good nose, than be obliged to use some of the dogs that have stood first in the ring. And this, I think, is the feeling of many, if not most, of my brother sportsmen in this country. They want the dog which will find the most birds, point them the most stanchly, retrieve them with most certainty, and be able to do this at least three or four days in the week—throughout the season, if necessary. If what I have assumed is true, the very general interest in field trials is explained, and I think that I hazard nothing in predicting that the accounts of those to be run in the autumn will be more eagerly read by shooting men than any previous cannine competitions that have been held in the United States. The importance of having the rules to govern the trials, and the directions to judges clear and concise, is self-evident. They should be brief, simple and couched in language that can by no possibility be misinterpreted or twisted from its legitimate meaning. In contests of this kind there is too often manifested a disposition to tind fault with the decision of the judges and even to wrangle: but by making the rules unmistakeably clear, and by choosing as judges men of undoubted reputation, there is no reason why the coming rials should not pass off without any of those unfortunate misunderstandings, to use no harsher term, which have disgraced such meetings of sportsmen in the past. While not professing any very profund kindwledge on the subject of dog breaking, I am accustomed to work my own dogs in the style that suits me, and I therefore venture to offer my views on the rules of field trials, as laid down by the two clubs already mentioned. It seems to me, in the first place, that several of the rules in the circulars referred to are lamentably obscure, and some of them, to my mind at least, convey no meaning whatever. On the whole, the rules of fie no one in my admiration of a beautiful animal, as near K. C., is rated at 20, and in those of the E. F. T. C., at 15. The latter, I think, is the proper figure. Nothing is more wearying and annoying than to follow a potterer, and "pace" is certainly one of the most important attributes of a good field dog. Backing is rated at 7 in one set of rules, and 8 in the other; too high in both. To a well bred dog it is as natural to back as it is to point, and I have seen "See "double bred south these south." "pace" is certainly one of the most important attributes of a good field dog. Backing is rated at 7 in one set of rules, and 8 in the other; too high in both. To a well bred dog it is as natural to back as it is to point, and I have seen, as no doubt have many others, young pupples, that had never seen a bird, back as stanchly as the best broken dog. The puppy has inherited his disposition to back from his well broken ancestors, and, besides this, his attention is fixed and his curiosity aroused by the stopping of his companion and the rigid attitude which the latter has assumed. The breaker merely cultivates and fosters this inherited tendency to stop at the sight of a pointing companion; and to teach a dog to back—a well bred dog, be it understood—is one of the easiest of the handler's tasks. For style the marks are 6 and 7. As I have already indicated, style in pointing is quite as important as style in ranging; and if, as seems probable, the style referred to is only style in ranging; at should be explicitly stated that this is the case. I am disposed to think that if in style pointing and ranging are included, the marks assigned to it in the rules are not far from the proper number. Stanchness, 6 and 8. I know of but one attribute of a field dog that is more important than stanchness. No matter how many good qualities your dog may have, if he is not stanch he is not worth his salt. Many a man hunts over a dog that does not pretend to mind, that goes about hunting in his own way, has no style, potters, very likely, perhaps even does not retrieve, but when he finds the bird he stays there until the gun comes up. He will never flush, will never leave his point unless dragged away by main strength. The owner of such a dog thinks he has a treasure—and he is right in so thinking. He may lose some birds because his dog does not retrieve, but not nearly so many as he would if the animal was unsteady. Stanchness I consider of the very highest importance, and I would make it much higher than is here done. In the N. come it, or drop, when ordered, should not be entered in the trials. There should be also, I think, a penalty of not less than 6 for wilful flushing. Simple flushing from excitement or heedlessness should be punished by loss of marks in pointing." In the instructions to judges there is nothing which calls for anything but praise, until we come to backing. Here we meet with a clause badly worded. The instructions in both circulars say: "To get credit for a back, the dog must stop at least ten yards (when practicable) in front of the handler." This rule is intended, we presume, to prevent the person working the animal from ordering the latter to stand, but this seems (when practicable) in front of the handler." This rule is intended, we presume, to prevent the person working the animal from ordering the latter to stand, but this seems unnecessary, for the presence of the judges would restrain the handler from speaking to his dog, and if their presence does not, the distance of thirty feet would not prevent his giving the necessary command. There is here a looseness of phraseology which, I think, offers an opportunity for a quibble. opportunity for a quibble. Stanchness is not clear. The dog may come to a point

on birds, but if they run it is clearly his business to break his point and follow them, whether he is ordered on or not. Ranging and quartering in the E. F. T. instructions are clear enough, but the definitions are too general. In the N. A. K. C. instructions, however, I am unable to understand what the definition of quartering intends to convey. What does working "at right angle to the bandler" mean? Does it mean at right angle to the bandler is pursuing? I presume so. If it does not mean that it means nothing as far as I can discover. In practice a does scarcely

convey. What does working "at right angle to the bundler" mean? Does it mean at right angle to the bundler" mean? Does it mean at right angle to the course the hundler is pursuing? I presume so. If it does not mean that it means nothing as far as I can discover. In practice a dog scarcely ever works at right angle to the course of the shooter, but usually at an angle of about 45° with it. His course is that of a smart sailing vessel tacking against a head wind.

And now a word about the scale of points for judging, and I am done. I have already stated that, in my opinion, the marks for the different attributes of a good dog are not divided as they should be in view of the relative importance of the various acts to be performed. Nose is certainly the most important qualification that a dog can have. You can, by care and patience, teach him almost anything, but you can never teach him to have a good nose; he must be born with that. Without nose he is, of course, utterly valueless for hunting purposes. With nose he can, with sufficient training, be made of some use. Nose and judgment, or intelligence, usually go together, though judgment is after all, only another term for the experience which can only be acquired in the field. This combination of qualities corresponds more or less closely with what is called "pointing." but it seems to me that finding would be a more fitting term by which to designate it. Finding, then, should rank the highest in the scale of points, and should not be marked less than 30. After finding comes stanchness, which, as I have already tried to show, should have a high mark, say 18. Pace comes next, and this I would rate at 15. Retrieving is only less important than pace, and saves the weary shooter many steps and many birds. I would place it at 10. This is a point that requires to be carefully watched by the judges, for although most dogs retrieve, the percentage of those who do it properly, i.e., with a tender mouth, returning the bird to the hand cheerfully, is very small. Style is a

EASTERN FIELD TRIALS.—The following is the programme of the trials to be run by the Eastern Field Trial Club next fall:—The Second Annual Meeting will be held under the auspices of the Eastern Field Trials Club, ast Robin's Island, Peconic Bay, Long Island, N. V., on November 29th and 30th and December 1st, 2d, 3d and 4th, Open to the world. All-aged stakes, open to all setters and pointers. Limited to 50 entries. First prize, 8200 : second, \$100; third, \$30; fourth, \$25. Entrance fee, 825. Forfeit, \$15. Puppy Stakes, open to all pointers and esters under 18 months of age. Limited to 25 entries. First prize, \$100: second, \$00; third, \$30; fourth, \$15. Entrance fee, \$15. Forfeit, \$10. Nursery Stakes, open to all setters and pointers under 18 months of age. Limited to 15 entries. First prize, \$60: second, \$10: third, \$20. Entrance fee, \$10. Forfeit, \$15. Club Stakes, open to all setters or pointers, five braces to run or prizes to be scaled. First prize, \$250: Second, \$10; third, \$20. Entrance fee, \$25. Forfeit, \$15. Club Stakes, open to members of the club only 1 dogs to be owned and hunted by the member making the entry. Prize a hundred dollar piece of plate to be selected by the winner. Entrance 10 per cent. of the value of the prize. This stake to be run after the close of the running of the Ernce stakes, and entries close on November 18th. Entries will be received for the open stakes up to midday of November 27th, at the office of the club, and on the grounds up to the evening before the trial. Entries must be accompanied by the forfeit money in all cases.

-Mr. Charles Lincoln, Superintendent of the St. Louis dog show, has sent us a number of premium lists and entry blanks, which can be had by calling at this office.

#### KENNEL NOTES

NAMES CLAIMED.—Brato.—Mr. George Norbury Appold, of Baltimore, Md., claims the name of Brave for pointer dog puppy, out of Kate, by Bragg. Lark.—Mr. H. G. Jerome, of Gale's Ferry, Conu., claims the name of Lark for his English hare bengle bitch puppy, purchased by him from Mr. N. Elmore. Mr.—Mr. A. A. Alkin, of Turner's Falls, Mass., claims the name of Max for his English hare bengle puppy, purchased dy him from Mr. N. Elmore. Binaparte and Lienau.—Mr. Thomas M. Smith, of Jersey City, claims the Lames of Bonaparte and Lienau for his brace of red and white setter pupples, whelped May 4th, 1850, out of Nell H. by T. O'Moore, Burges' Rufus-Stoddard's Friend', Nell H., Goldsmith's Flunkett-Nell. Nattic—Mr. Thomas, M. Smith, of Jersey City, claims the Larges' Rufus-Stoddard's Friend', Nell H., Goldsmith's Flunkett-Nell. Nattic—Mr. Thomas, M. Smith, of Jersey City, claims the marmed of Nell Mr. Deliver of Jersey City, claims the marmed of Nell Mr. Stoddard's Friend; Nell II., Goldsmith's Plunkstr-Nell. Natthe—Mr. Thomas. M. Smith, of Jersey City, claims the name of Nette for red and white blich puppy, out of Nell II., by T. O'Moore, Whist.—Mr. Charles B. Barnes, of Boston, Mass., claims the name of Whist for his lemon and white dog puppy, whelped July 9th, out of Sibel, by Rufus II., owned by Mr. Henry Smith, of Boston, Mass. Speed.—Mr. N. Elmore claims the name of Speed for blight and tan foxbound bitch puppy, presented to him by Mr. George Poundil, of Christiana, P. Flora Bell.—Mr. H. El. Stoll, of Corning, N. Y., claims the name of Flora Bell for his red and white

setter bitch, whelped July 20th, and presented to him by Mr. Ed. Deverson, of Oswego, N. Y., out of his Flora by Sport. ... Mr. George Laick, of Tarrytown, N. Y., claims the name of Mr. George Laick, of Tarrytown, N. Y., claims the nume of Alce for his red and white setter dog nuply, out of Mr. C. H. Hanpriman's Jessie by Mr. G. S. Sedwick's Ising. Metta—Mr. N. Elmege claims the nume of Meeta for the white, black and tan Enrish foxbound bitch puppy, presented to him by Mr. McKoon, of Frunklin, N. Y. Thor—Miss Copple, of Bethlehem, Payelaims the name of Thor for her 'smooth-coated SI, Bernard puppy, whelped June 7th, 1880, out of Mr. J. S. Schuyler's Josephine by his Guy. Filtr—Mr. William S. Thurston, of Huntington, L. I., claims the name of Firt for his lemon and white pointer bitch, whelped March 18th, 1880, out of Mr. R. T. Green's Girl, Maryland-Tell by Mr. W. P. Steel's Glemmark, Rush-Romp.

NAME CHANGED. - Neva. - Mr. George Norbury Appold wishes to change the name of his Irish setter bitch Bessie (formerly Red Betsy), out of Jessie by Boston, and recently unrelased from Mr. J. J. Jennelle, Du Quoin, Ill., to Neva.

WHELPS.—Rose.—Mr. S. C. Ellcott's Hose whelped two number WHELES,—Rose,—Mr. S. C. Ellectt's Rose whelped two pupples by Blosson. Mina—Nerv Pork, Ang. 3id.—Editor Forcet and Stream:—My kennelman writes me of the following whelps by my-champion Muna by champion Dash III.: "Last night (Aug. 20th) Mina whelped seven pupples, four dogs and three gyps, three pure white, three blue and white, one brown and white The pure while will probably be marked with orange; the brown The pure white will probably be marked with orange; the brown is very handsomely marked with tan around the margin; two are marked just like Mina, and one has black around each eye and white ears, a very singular marking. They are all strong and healthy and Mina doing well." WALTER H. BEEBE.

Brid - Madeap-Rollo,-Mr. G. D. Macdougall's (Lachine Ken-183. D. - Manderjo-Fronto, S. F. C. S. Balcoulomis (Laternine Rennels) black cocker bitch Madeap (second, Montreal, 1889 to Ribotertson's Rollo (black—second, Foronto, 1877) at Toronto, Aug. 20th. Cora: Wildoir.—Mr. G. D. Madedougall's (Lachine Kennels) liver colored cocker bitch Cora (Brst, Montreal; 3rst, New York, 1880) to the Hornett Cocker Konnet Caub's Wildair (black), at 1880 to the Hornett Cocker Konnet Caub's Wildair (black), at 1880 to the New York. 1880 to the Hornell Cocker Konnel Card's Wildar (black) Hornellsville, N. Y., Aug. 234, Moll-1968800. — Blosson Mr. T. H. Sundhman's Gordon setter bitch ——, to Dr. Niv Rlosson. Grace-Card — Mr. E. F. Merceliciti's champion b Grace to Mr. P. H. #### ONTARIO RIFLE ASSOCIATION.

Toposto Out - On the 23d uit the annual matches of the On-TORONTO, Out.—On the 250 titl, the annual materies of the On-tario Ritle Association commenced on the Garrison Common. The day, though bright, was not too much 50, and there was a fairly steady breeze blowing from the southeast. The arrangements which had been made by the Executive Committee were as nearly which had been made by the Jeastice Consider whether as is many perfect as possible, and all concerned deserve great credit for the manner in which the first day's shooting was carried out. The number of entries was not quite as large as last year, but the shooting was better. Three ranges had been laid out, comprising shooting was better. Three ranges had been laid out, comprising 17 targets, numbered from 1, by the Lake Shore, to 17, near the If targets, numbered from 1, by the Line Shore, to 14, hear the Exhibition Building. The first 3 targets were devoted to the Canada Company's match, and the remainder to the Macdonald for the first part of the day, and to the Affiliated in the atternoon.

The several matches shot and decided were as follows: The several matches shot and decided were as follows:—
Canada Company Match.—Restricted to the active militia of the
Province of Ontario who have never won a prize at any provincial or dominion association; 7 shots at 400 yards; cash prizes,
\$200: Private Henderson, Twenty-lifth; 35; Capt. Hunter, Thirtysecond, 55; it won by Headerson. Lieut. Bilott, Seventh Fosticers, 33; Private Morrison, Guards, 31; Private G. Glennie, Dufferin Rilos, 33; it down by Glennie. Lieut. Colby, Thirtleth, 39;
Gunner Kennedy, Napanee G. A., 30; Corp. Dunn, Thirty-Infth,
30; Adjl. Corls, Twenty-Infth, 30; Capt. Train, Twelfth, 30.
The Macdonald Match.—Seven shots at 200 yards; any position;
twen to members: total cash prizes, \$300: Sergar, Armstrong.

The Macdonald Match.—Seven stores it 200 graves my position; open to inembers; total cash prizes, \$300; Sergt, Armstrong, Guards, 31; Lieut, Moore, Twenty-fifth Bartailon, 31; Private Schwarz, Thirteeenth Battallon, 32; Private W. Jack, Tenth Royals, 32; Lieut, Waldo, Guards, 32; Mr. C. Wilson, Second Military District, 32; Private Kilpatrick, Twenty-fifth Battallon, 32; tary District, 32; Private Eupatrices, 'neemy-a-int Battanion, 32; Lorgt, T. Mitchell, Luctat.-Col. (filson, Thirteenth Battalion, 32; Sergt, T. Mitchell, Tenth Royals, 31; Major Wilson, Thirty-third Battation, 31; Lieut. Adams. Thirteenth Battalion, 31; Private C. N. Mitchell, Tenth Royals, 31; Sergt, Panie, Thirteenth Battalion, 31; Lieut. Fox, Twentieth Battalion, 31; Lieut. Fox, Twentieth Battalion, 31; Lieut. Fox, Twentieth Battalion, 31; Aleut. Fox, Twentieth Battalion, 31; Chent. Fox, Thirteenth Battalion, 31; Chent. F

Thirteenth Battahon, 31; Lieut. Fox, I wenned Battahon, 31; Sergt. Thompson, Q. O. R., 31. Alfillated Match.—Open to me mbers: ranges, 200 and 500 yards; 5 rounds at each range. Team prizes: The ladies' Chaltenge Cup, value, 550 and 501; second prize, 530; third prize, 530; fourth prize, 515; fifth prize, \$10. Individual prizes, \$256 cash: Private Moore, value, \$50 and \$10; second prize, \$50; (into prize, \$50); forth or prize, \$15; fifth prize, \$10. Individual prizes, \$285 cash; Private Moore, Georgetown R. A. 47; Lieut.-Col. Gibson, Thirteenth Battalion, 47; Major Bennett, Fifty-eighth Battalion, 46; Color Sergel, Hanceck, V. H. C. 46; Private Marris, Thirteenth Battalion, 46; Private Marris, Thirteenth Battalion, 46; Private Mayals, 445; Private Masson, Thirteenth Battalion, 45; Lieut. (rowe, W. F. B., 45; Mr. J. L. Cox, Second Military Bistrict, 45; Private H. Johnson, Sixth Fusileers, 45; Mr. Todd, Parior R. A. 45

District, 43; Frivate A. Journal, Ext. Instance, 55; Johnson, Bruce R. A., 4-First prize, ladies' challenge cup, value \$150, presented by the ladies of Toronto, and \$10-Thirteenth Hattalion, Hamilton, 219; second prize, \$40, Ottawa Bulle Chib, 210; third prize, \$50, Sixth Fusileers, Montreal, 205; Journa prize, 520, Fixed Prize, \$50, Sixth Fusileers, Montreal, 205; Journa  prize, \$50, Si St. Thomas Rifle Ciub, 204; fifth prize, \$10, Guelph Field Battery

os.
The Gilmour Match-Presented by the President; 7 rounds at The Gilmour Match—Presented by the President; 7 rounds at 500 yards. Total cash prizes, \$300. Capt. White. Thirty-fourth, 31; Sergt. Allenby, Twenty-second, 31; Capt. Struchar, Forty-seventh, 31; Mr. John Sten, C. O. R. A., 33; Major Wilson Thirty-third, 31; Lieut. Wilkinson, Q. O. R., 32; Capt. Anderson, Second Mil. Disk., 32; Mr. W. Bruth, L. R. C., 31; Lieut. Adams, Thirtcenth, 31; Staff Sergl. Lewis, Q. O. R., 31; Private G. W. Patt. Sewenth Polsebers, 31; Private Moore, Twentieth, 31; Staff Sergt. Shanay, Thirty-fifth, 31.

On Thesday afternoon the Gordon match was finished in had

banay, Thirty-fitth, 51. On Tuesday afternoon the Gordon match was finished in bad weather, and consequently, with one or two exceptions, the shooting was not good. The following is the score: 7 rounds at 500 7 rounds at 500 yards; open to members; eash prize \$250: Major Hughes, Forty-lifth, 31; Mr. F. Oakley, Second M. D., 29; Sergt, F. H. Bailey,

Forty-seventh, 29; Staff Sergt, Walker, Q. O. R., 28; Lieut, Snart Dufferin Rifles, 28; Gunner Treleven, Cobourg R. A., 28; Sergt. Mitchell, Thirtcenth, 28; Cupt. Mason, Thirteenth, 28.

During the night it rained heavily, and a heavy gale blew from Dotting the might trained heavily, and a nearly gate new from the eastward. Those who had camped out were not much incon-venienced, as the tents were well sheltered. At 9 o'clock the fir-ing communiced, the matches for the day being the Merchants' cup, for latitation teams, and the Brassey cup, for company teams, besides the Extra Series match, for special prizes. reams, necessitive fairth series mutant for special prizes. Great interest was attached to the cup matches from the circumstance that if the Thirteenth won the Merchants' it would become ther also dute property, they having secured it the two previous years, while the same wou'd happen if the Guards won the Brassey. The ores of the day stood :

scores of the day stood:

"Merchants-Prassey">–200, 500 and 609 yards; 7 shots each range

The conditions of the match are: Professionals debarred—A professional rifeman as interpreted by Col. Sanford before the National Rifle Association. Two hundred yards; off hand. Shots, 7; no sighting shots; pool targets will be open for preliminary practice; eny rifle. Military rifles, 1 point allowance; full scores cannot be beaten. Entrunce foc, 91 each for first and score cannot be beaten. Entrunce foc, 91 each for first and score cannot be beaten. Entrunce foc, 91 each for first and score annot he beaten chances at 9.30. All, entries received up to 4:39 Pal., match closes at 5 P.M. Prizes distributed on the day of the match. A shot may be challenged according to the N. R. A. rules; should the challenger be correct he will receive \$1 in addition to his deposit. Ties, equal scores, irrespective of the usual Creedmoor rules, to be shot off, 3 shots each, or any plan mutually agreed upon by those lying. To win either the first, second, third, fourth, 61th or sixth prize, the total of the two best scores of each competitor will be councied; single entries for all the rest. Any dispute which may arise not herein provided for, will be settled according to the rules of the N. R. A. by the officer in charge of the match. Only one prize can be won by each entestant. The list prize when the sufficience are invited to participate.

NEW ORLEARS, La., Aug. 221.—The first competition for the

down. All riflemen are invited to participate.

NEW OBLARS, La., Aug. 221.—The first competition for the
prize offered by the officers of the First Division L. N. G. took
place this evening at the Washington Artillery Ranges, Spanish
Fort. The weapon used was a regular army rifle, but some of the
men had been out of practice for over a year, and consequently
their archievements were meansiderable. The prize is to be won
three times before becoming final property. The following is the score : -

The gold medal donated by General McComb for the highest score made during the tournament was won by T. L. Wilson, First Licut. of the Fourth Artillers, with 273 points.

Boston, Mass., Aug. 28th.—At Walnut Hill, to-day, the usual short range matches were shot. The day was a fair one for the marksmen, although the wind, blowing strong from 8 o'clock, caused some trouble and necessitated constant watching, but careful attention by the gentlemen present resulted in some excellent scores. Subjeined arc the scores:—

THE MUG-HUNTERS' CHAMPION.—Hoston, Aug. 27th.—Editor Forest and Stream:—Why do you not, in the next issue of Forest AND STREAM, give all ist of the names of those whom you desire to stigmatize as "mug-hunters," or those who "shoot for the stigmatize as "mug-hunters," or those who "shoot for the stigmatize as "mug-hunters," or those who "shoot for the stigmatize as "mug-hunters," or those who "shoot for stigmatize as bould only come to shoot at a target, and sternly and with majestic indignation should decline all prizes. Of course the "Leech" and "Wintbledon" "mugs" "must not be the stigmatic than the stigmatic and stigmatic and stigmatic the stigmatic and stigmatic the stigmatic and stigmatic the stigmatic and stigmatic

these impertinent and impotently malicious affinitions. Be sure they will recoil upon Forkers and Strana, as a bad rille does upon the marksman.

A READER.

The remarks in our columns on the course of those who are notorious for the avaricious element in their shooting have evidently struck home and brought out the above transparently amonymous protest. We can assure "a reader" that while the Wimbledon and Leech trophies shot for at Creedmoor are, in truth, "mugs," they can never become the prey of the mughanter. Of course, a meeting without prizes, or without some emblem of victory, would be an anounly and almost an absurdity, but there is a wide difference between generous rivalry for emblems of victory, and making the possession of these prizes the whole aim and object of the struggle. We have seen rifference who have gone into a match and have acquitted themselves to well as to be adjudged worthy of a prize; and then, and not till then, did they concern themselves to find out what that prize was. This is one spirit of rivalry. Another one goes into competition as he would into a commercial speculation, considering his time and effort wasted if he he not the winner of more in cash value than he has spent in time and money; his point is to win, honestly if he can. spent in time and money; his point is to win, honestly if he can, but to win, and we have, as a result, the Wimbledon scandal and such squirming protests as that given above.

ANNUAL REPORT FOR THE SEASON ENDING JUNE 30TH.

ANNUAL REPORT FOR THE SEASON ENDING JUNE 20TH,

BECAUSE of the preciminence in archery to which Mr. Horace
A. Ford attained, it is quite natural for us to acquiesce in
any opiniou by bim formally advanced with reference to his once
favorite pastime. The more faith is due to these opinions, thecause, like his arrows, they were all carefully delivered and with
an aim. So careful was he in determining the truth of a theory
before advancing it, that in the years that intervened between
the appearance of the first and second editions of his work on the
theory and practice of archery he did not wish to modify any idea
which he had at first adarneed. To many of us his theories seemed
which he had at first adarneed. To many of us his theories seemed
so revolutionary that we were loth to adopt them, but no one can
faithfully study his book without yielding to his unmawerable
logic, backed by his unapproachable skill. Looking to him as
we do, as a model, who combined almost complete knowledge of
his art with matchless powers of execution. It is the part of wis
dom to give the utmost heed to his free and generous advice.

Nowhere he liks writings, however, appears a nore valuable
turth than he conveys in these words: "Those who have not been
in the habit of having one (daily register) can have no iden of the
great interest with which it invests the most solitary practice, and
how conducive it is to its steady and persevering continuance. It
begets a desire to improve, for no man likes to have evidence before his eyess of his pains and exertions being of no avail, and
himself at a standstill in any pursuit be takes an interest in. It
insures a due carefulness in the shooting of every arrow, since
without it the score will be bud, and, therefore, disagreeable to
chronicle. It excites emulation, by enabling one man's average
shooting to be compared with another's, and restrains by its
sternly demonstrating fayures those lights of imagination occasionally indulged in by had memories as to feats performed and
accors achi

rapid has been the change by members from the shorter to the longer range. Class I, showed but a single member who shot an arrow at 100 yards, and he only 4 scores of 72 arrows, while almost 100 scores were shot at 00 yards. In the other classes the penchant for short range shooting appeared equally strong. In March the York Round began to be shot, and quife a respectable number of 10) yards scores were recorded. Still in that month several members in Class I, did not shoot an arrow at 100 yards, rotably such the archers as 0. W. Kyle and Tae Hussey, while Dr. Weston only recorded I score at 10) yards, as against 73 scores at 00 yards, The other classes scarcely did so well. In April a vast improvement appeared. In Class I, with the exception of one new member, the shooting was nearly all done at the York Rounds, nearly every member of this class shooting more arrows at 109 yards than at any other range. any other range.

any other range.
It is needless to say that the shooting was far hetter than ever before, even at the 60 yards range. It will always be so when the long ranges are most practiced. If one desires to shoot well at 60 yards no practice is so good as that at 100 yards. In the month 69 yards no practice is so good as that at 100 yards. In the month of April Dr. Weston, who had calong to the 0 yards range so tenaciously during March, averaging 10 245.75, now recorded 19 York Rounds without a single extra 60 yards score. The result was 80 at 161 wereage at 100 yards was exactly doubtled, and his 60 yards

average increased.

Mr. Will H. Thompson, who did not score a single York Round
In February, and only 4 scores at 100 yards against 21 scores at
100 yards in April, recorded 15 York Rounds and only 4 extra scores
at 60 yards, in all 1,680 arrows at 100 yards against 155 arrows at
60 yards. The result was that bis average was increased at 100
yards from 87 points in February to 138-15 in April, and at 60
yards from 1654-7 to 120 points. The rame general includery to
abandon the short range shooting for the York Round in its co-

threty appeared in the records of all the members of the society, and has since continued. As it thus conclusively appears that the members of the Private Practice Club have been, by their attachment to the club, drawn to love and practice the long ranges tachment to the club, drawn to love and practice the long ranges and necessarily to keep a true record of every arrow shot, the question is pertinent. What proof appears that they have advanced more than archers who have pursued a different course?" The Grand National Meeting at Buffalo gave most convincing evidence that with rare exceptions the general advance of archers throme bout the country has not keep take with that of the members of this society. At that meeting, out of the IT highest scores recorded, 12 were opposite the names of members of the Private Practice Club. Among the 19 lowest scores can be found only two

Practice Club. Among the 19 lowest scores can be found only two names of members, and one of these shot only half the number of arrows. Could there be a stronger argument advanced of the worderful advantage to be derived from membership?

Not that the other members of the society can aid the individual, but that his honor is bound to a certain method of practice which necessitates improvement. How strikingly the theory that practice at long ranges will assist the archer at short range was exemplified in the team shoot. The team winning first place was composed of 4 members of the P. P. C. The highest score at both 50 yards and 40 yards was made by a member of the P. P. C. Who had shot only 3 scores at 40 or 50 yards in the year 1890.

Reversing the system, let us ask the advocate of short range practice [34] would be possible for an archer wis host been shooting only at 40 and 50 yards for one year, or for a lifetime, to accomplish a like result at a public meeting at 100 yards and 80 yards and 80 yards.

gonglish a me result at a public meeting at the yards and to yards?
We have said that a characteristic of the good archer is to desire to attend and take part in our great public meetings. The founders of the P. P. C. believed that its members would naturally founders of the P. P. C. believed that its members would naturally be attracted toward the National meetings, and the result has proved that they were right. Of the 31 members belonging to the club at the date of the National meeting, 14, almost one half, attended and took part in the tourney. Of those who did not attend 4 were selex and 2 beyond the Rocky Mountains. The 6 gentlemen who traveled the greatest distances to attend to meet-

gentlemen who traveled the greatest distances to attend the meet-ing were all members.

It is unnecessary to multiply evidences of the fact that the club has been a powerful aid to the National Association and to archery generally, as well as to its members, by inducing a

and to archery generally, as well as to its members, by inducing a strong fraternal attachment among the members, which served to draw many of them to meet and compete with their classmates at the National meeting.

There being no real objection which can be urged against the "theory and practice" of the Private Practice Club, there is usually but one objection offered by archers why they do not attach themselves, and that is the necessity of keeping and preserving

That this one thing has more than almost anything else to do

That this one thing has more than almost anything else to do with his improvement the archer will soone or later find out, and we hazard the declaration that the archer does not live who will not over-ealimate his ability unloss he has preserved all his scores. One objection made against the club by certain archers was the fact that the club offered cash prizes. This objection was removed by the change made in the constitution at the business meeting held at Buffalo when such prizes were abolished. While no member objected to the abolition of cash prizes, and while a great pressure was brought to bear upon the National Association to induce it to abolish cash prizes, it as curious fact that out of thirty-three gentlemen who attended the national meeting and shot the Double York Round through, twenty-six both in the subscription handlesp, and three other gentlemen, to our own knowledge. Mr. Peddinshaus. Mr. Burnbam and Mr. Booe, were in favor shot the Double York Round through, twenty-six shot in the subscription handleap, and three other gentlemen, to our own knowledge. Mr. Peddinghaus, Mr. Burnham and Mr. Booe, were in favor of each prizes, and failed to shoot in the handleap only because they were very tired, and preserved themselves for the team shoot, So it would appear that opposition to each prizes is only made by a few persons, and they such archers as do not expend the time and money necessary to attend our great public meetings. Of course there are exceptions, as we met two gentlemen shooting throughout the meeting who were opposed to cash prizes. But at any rate the Private Practice Club, out of its sincere desire to do good to as many archers as possible, removed this bar to the admission of the opponent of such prizes, and we shall expect to see the club enlarged from their ranks. The reclassification of members to be made by the Secretary, as provided by the amended constitution, will make the practice of members much more pleasant, as archers will now compete in classes where the members are more nearly upon an equality. The amendment to the constitution required the Secretary to place members of like average skill in the same classes, so as to give as nearly as possible an equal number of members to each class, and he has done so to the best of his power, though in endeavoring to do so be has found it necessary to give class ILL a few more members than either of the other two classes. There are many good reasons why the third class should be the larger one, if equality of members is not attainable. Archers shou addission desire place in the third class. After much comparison of records and taking into consideration the scoring of each archer at each range, the secretary has re-classified the club as follows: CLASS I

L. L. Peddinghaus. Tsc. Hussey. Will H Thompson. Edwin Devol. C. G. Hammond.	Maurice Thompso Lorenzo Devol. Frank H. Walwor Jessie B. Devol. E. B. Weston.
	CLASS II.
Ford P. Hall, P. S. De Graff, O. W. Kyle, Geo. F. Henry, C. C. Moore.	E. T. Church, T. R. Willard. J. D. Patterson. C. G. Slack. A. S. Brownell.
	CLASS III
Howard Fry. E. P. Chester. C. E. K. Baxter. W. Holberton. W. H. Dorrance. H. E. Jones. E. P. Bartlett.	C. W. Sherman. W. P. Lacey. E. F. Wells. W. C. Beecher. William Jones. M. D. Ewell.

E. P. Bartlett.

No doubt the classification is faulty, and there are one or two members in the second class who would do henor to the first, and some in class III. whose rightful position would be in the second grade, but no division could be perfectly fair, and these errors of place occurred in several cases from the fact that the archers failed to return the scores for April, May and June.

(TO CONCLUDE NEXT WEER.)

New Jersey.—New York, Aug. 20th.—Below you will find a rough draft of the archery match to take place at Waverly Park, N. J., during the twenty-second annual fair of the State Agricultural Society. The society will provide liberal prizes, and as the entrance fee is low, viz. 8.1, it is to be hoped that the archers in this vicinity will turn out strong and give good encouragement to the managers, who are trying to introduce this noble pastime

to the public. Wednesday, Sept. 22d, 10 A.M., match for the New to the public. We denotedly, eepc. 224, 10 A.M., match for the New Jersey State championship, open to residents of the State only; gociety's gold medal and other prizes; single American round. Afternoon, 2 P.M., ladies' team of 3; open to all, Columbia round; gentlemen's team of 4, open to all, American round; also a long range match of 24 arrows at each 60, 80 and 100 yards. Further particulars hereafter.

W. HOLBERTON.

The scorer of the Newark innings should be more careful in his

The Montreal team went to the bat for a second innings and rolled up 115, but darkness set in by the time they were disposed of, and the game was decided on the first innings scores.

YOUNG AMERICA vs. GIRARD .- The long talked of match be-Young Angeled as Grand-The long analog of marked of the ween these first-class clubs came off, as announced, on Aug. 20-21st in the presence of a large number of spectators. In a late number of the FOREST AND STREAM we predicted that the champlons would have their bands full, and although a cricket match is never lost until it is won, our calculation, as shown by the score, was not a wrong one. Being a two days' match, its result was undecided, but it may be considered a virtual defeat for the champions. In fact, the latter were no less disappointed than the victors were surprised. The Young America players were, with two exceptions, remarkany dedicint at the bat, their bowling was far below the average, and the fielding far from perfect, while the Girard men developed unexpected strength at the bat and fielded sharply throughout. The full score is appended:

### OUR ENGLISH LETTER.

CARRINGTON STRELT BRIDGE, Nottingham, Aug. 14th.

CARRIMOTON STRELT BRIDGE, NOttingham, Aug. 14th, Editor Forest and Stream:—

The Australians have not up to the present time lost a single match, although they brave had to play fairly strong elevens and twenty-twos, assisted in many instances by several first-class professionals. I am inclined to think that it would take a first-rate Engitals cloven to heat them, although the extremely wet and unplayable wheekes baye no doubt assisted them to a very material extent. They are a very fine hody of cricketers, good at all points of the game, and, what is still more, "gentlemen." I hear they finised visiting America on their way home, and no doubt will attract large crowds wherever they go. There is every probability of a match at the Oval between them and an eleven of Earland some time this month; the Oval committee having sanctioned the use of the ground, atthough I am straid it will not be a representative English team, as several well-known players have expressed their determination not to play against them. There is no doubt that the unpleasantness with Lord Harris' team in Australia has been the cause of their not playing any strong team here, though I and many thousand Englishmen would be sorry if they were to quit our shores without showing their strength. It is but fair to state, however, than on their arrival in England they offered to cancel any previous engagements to play a match either at Lord's or the Oval

Arthur Smith, the professional, whom we have sent out to Detroit, is a native of Nottingham, about 23 years of age, a very me all-round cricketer, and I have not the slightest hesitation in stating that he is much the best professional on your side, and in all probability, if he had stayed at home, he would have played for his county this season.

for his county this season.

#### AFTER THE BATTLE.

If it were possible to have a competent reporter on board every yacht engaged in racing or while on a squadron critise, the performance of minary a critic would be paint of in very different colors from what it is. During the critise of the N. Y. Y. C. recently brought to a close, many interesting features have been lost, and

wrong interretations here gained currency accordingly. The Rever, for examine showed the form in rough water and very fuir speed, beating Wizard, Active and Regina in turn, but during the latter portion of the cruises she could not be drived, owing to her owner having hurt his knee. The Muriel, as now acknowledged by all hands, is a time little flyer in open water, and hung on edged by all hands, is a time little flyer in open water, and hung on your speed of the property of the center of the center hands in a way that caused general remark. In short boards show soaked "out to windward of the center-hoard shops in spite of a fout ride. At the time she had two cringles down in the matisail, single reeff foresail and small jib. "We had the matisail, single reeff foresail and small jib." We had the matisail in the matisail, single reeff foresail and small jib. "We had to it season sure. An esteemed contemporary is even quite euthusiastic in her heald." Now, we think that with a little more beam, to give a less angle of facel and a little less draft for home waters, a cutter can be tenganded with the surface of the forest of the future," and every season sees the coming type growing more popular and better understood. We learn that some large from oraft, a cutter and schooner, are contemplated for max season. Proportions of Mischief, with considerable dead rise and a center-board, while in rig she is to be a full blooded cutter. This rig is rapidly gaining favor, and it would not be surprising to find all large single suckers in the future come out with the smack's of the cutter. As might have been expected, the two scrub runs in which Gracie "beat" Mischief, or rather, was erroneously reported as beating fice, admit of ready explanation. From New London to Greenort, Mich, or suffice and the cutter. As might have been expected, the two scrub runs in which Gracie "beat" Mischief, or rather, was erroneously reported as beating fice, admit of ready explanation. From New London to Gracie state, and the content of the c

### HULL YACHT CLUB.

HULL YACHT CLUB.

THE union regatia of this new organization was set down for Thursday, Aug. 25th, and brought out a big lot of starfers. The manner in which new dubs spring into life in the East, and make a name for Homesleves in the first year of their existence, speaks volumes for the popularity of the sport mounced than a perfect run is under upon the secretary, and the entries foot up by the score. That such an amount of spirithouls be shiblid on the part of owners is most creditable to them, and indicate which are the part of owners is most creditable to them, and indicate york of the part of owners is most creditable to them, and indicate york of the part of owners is most creditable to them, and indicate york of the part of owners is most creditable to the part of the

ATALANTA, Salide for New York from Halifax, Aug, 27th,
The Entreup.—The Aorth British Brilly Mail says: "Yeserlay forenous (Sanday) there came to moorings in the bay,
lose to the Bootian, the schooler staling yadic Intreelid, of
yor seen on the west coast. She crossed the Atlantic with her
were seen on the west coast. She crossed the Atlantic with her
were, Mr. Lohy Phoenix, and a party of friends, on board, and,
awing first visited freshod, is now making a cruise about these
arts. An ind Cryde gaeltsman, with whom I had a look at and
er bean anadships, where it was wanted for such a bout, and I
oft bound to agree with him in the remark, that "you could go
ound the world in that craft,"

Anout Catamarans.—Editor Forest and Stream.—Intelligent of steam patamaran to attain a high speed on her trial trip, because they had no faith in the propeding power used. Believing, as that she will go faster that the steam patamaran to attain a high speed on her trial trip, because they had no faith in the propeding power used. Believing, as that she will go faster that the steam of except pipe a perspective of a proper propelling power is used, I desire to give my experience with a similar spherical form. Four years ago I purchased a section of a condemned lower mast of a ship, and, after sawing it sailing catamaran, which have used for the seasons. The span had a diameter of two feet. The length of the craft is slift, and its draft is loin. To my surprise I found it had a very irregular speed. Sometimes it would seem to leap, and again, with a stail would nove easily and rapidly; but the least daturbance, or roughness of the water, would materially diminish its speed. I have passed, with a strong, the wind, through the rips, where the water was very lumpy and broken, caused by a rocky bottom, same chance in quiet water, she would go mine. Although she has a large conter-board, sometimes, in tacking, she would refuse to start altead, making much lee-way; at others she would start with a rish. We can see the reason for these variations of speed, path passage, or it will certainly check the speed of the vessel. Much of the propelling power exerted passes or is transferred to the office of the content of the start and the several will be start the search of the start the surprise from before her in a current under her to the stern, and the speed will us steady and regular; but it the them the start will be a surprise of the search of the propelling power exerted passes of its transferred to the other of the search of the start along the search of the water under a vessel's bottom. Now, if a vessel has a form that will preserve his pressure at all times, the current will be naturally supplied to the steady and r

matural and venical consistency of which we form vession right, inmatural and venical consistency of the sole, all the water with
pass under them.

To understand how this movement of the water is brought
about is interesting, because a vessel can only press the water
ahead of her in the direct line of the power upplied; except when
we give her the form of a wedge, we drive it at right aggles to
into a pile as she does she increases the pressure of the piled upwater in horizontal lines all the way to the bottom, beyond that
of the surrounding water, and as at the same instant she has by
moving reduced the pressure on a column of water at the stern,
the water overpressed presses toward that, haring reduced pressel is set in motion, sternward, by the pressure that comes from
the piled up water. If I am right in this, it follows that the bottom on which the water rests is the point where we get our power
to move water, and it follows that the form of the bottom of the
vessel is of great importance, that it should be as near a flat acousty objectionable lee tuse they allow the pressure contained in
the water, which we late added to it, or escape to the surface.
There must be a constant leakage of this pressure, which leakage
would be greatly uncreased as the propelling power was greater.

New York, Alog, 2d.

We are inclined to ascribe the fitful sailing of the catanaran to
We are inclined to ascribe the fitful sailing of the catanaran to

We are inclined to ascribe the fitful sailing of the catamaran to We are inclined to ascribe the artiful standing of the cardinaria to the small displacement and momentum more than, to the reasons Mr. Cole offers. Owing to small momentum in comparison to resistance and frictional surfaces, the both very easily loses her way and also as suddenly starts off upon the application of drivway more as sameny sure on upon the appreciation of anting power. Her slackness in stays especially is to be attributed to want of weightas well as the spread of the hulls. But apart from this, the speed of salling catamarums affords no clue to the performance of the same sort of vessels under steam.

The problems have no analogy. The sailing cananaran derives speed from the possession of excessively large stability and sails and excessively small build and resistance. In steamers, however, it becomes a question of weights, and the catamaran's excessive the sail of t and excessively small hull and resistance. In steamers, however, it becomes a question of weights, and the catamaran's excessive stability counts for nothing in driving her. The two hulls and connections will weigh more by 30 to 50 per cent, than a single buil. This much is therefore lost to the weight of the driving power, and the catamaran's engines and holler must, on a given displacement, be lighter than those of an ordinary vessel. Be sides this, the resistance to the two hulls, even when eigher-shaped, must be greater than that of a single hull. They offer increased friction surface; their proximity to one another interferes with the "stream-lines," and both together will certainly create more waves than one hull. Every time you build a fast esteam catama ran, you could have built a faster single hull vessel for less money on the same displacement. For that matter, if you' believe 'in the cigar-shape, it can be adopted in one hull just as well as in two. We have been led to these remarks to counteract the prevailing ballinemation that there is any similarity or anything in common between sailing and steam catamarias. The latter have a future, perhaps, where large deck room, great stiffness and only moderate speed and economy are required, as for ferryboats, cattle transportation and excursion purposes, and then they must confine themselves to smooth water. As "high speeds," set them down as an impossibility. down as an impossibility.

the information you seek.

M. C. S., Philadelphia.—I write to inform you that the mixture of one drachm spirit camphor; buff drachm of terebinth, and ten unims of acid carbolic, did not kill the flesson my setter day. It seemed to stupefy them, but they recovered and were as fively as ever in a couple of hours. Ans. Should apply a tablespoonful, in half pint of chilled water, to be rubbed into the skin with a piece of launel for three or four days, washing thoroughly with soft soap and warm water an hour after each application. Chicketen, Boston, Mass.—How is it when a one day's match is played and decided by the first himigs? Does whatever part of the game that is played after that go on the average of the bowler or batter, as in the match Statu Island e. Longwood? Ans. Every ball bowled and every run scored during the day's play is taken into account. For instance, it was possible that the Island club could have been disposed of for no runs in their second innings, and then there would have been firm for the Longwoods to commence their second limings, and they maght bave shared the same fate before time was called. It is the uncertainty of cricket that helps to make it so attractive.

R. I. G., Montreal.—About five weeks ago a cocker spaniel blich mine, aged seven months, was run over by a wagon, two

R. I. G., Montreal.—About five weeks ago a cocker spanied inten-of mine, aged seven months, was run over by a wagon, two whicels running over her belly. She suffered intense agony for two or three minutes, when she quieted down. I carried her home, not having far to go, and gave her a hot water lath and kept her locked up for a short time. She seems to be just as lively as ever, but I would like you to inform me through your columns if you

locked up for a short time. She seems to be just as lively as ever, but I would like you to inform me through your columns It you think it is likely to kill her if she ever has pupples. I am told it is very probable. Am: If she gets with pups there is no reason why she should not be afely delivered at the proper time.

A. G. C., London, Canada.—Will you please prescribe for my setter pup about six months old. One of his hind legs is very lame, caused by getting it, when lying down, under an iron rail, and getting up suddenly, bending it some way. The leg is not swelled in the least, and he does not appear to suffer much pain. He has been lame for about two weeks now. When standing he can put his foot on the ground, but cannot walk. Ans. Better have him carefully examined by a surgeon. He may have received a local injury which will require surgical skill to relieve. If it is simply a sprain, then rest and freticn, with some simple stimulating ofintment, will relieve him.

BEDFORD, Westchester Gounty, N. Y.—My Nowfoundland dog, eleven months old, has a spot on the outside of bis car, which I think is a ringworm. Will you be so kind as to tell me how to treat it? It is about the size of a half dolar. The hair has partially come off. The edge of the circle has a sort of yellowish seab, and inside that the skin looks a little inflamed and is covered with white flakes. He does not like to have it touched. I gave him a beginning teasmondry of suitable raday. An a Representation of the circle of the standard of suitable of the destandard of suitable dates.

scan, and instead on an use seen cooks a tree manage and with white flakes. He does not like to have it touched. I gave him a heaping tempoon tul of suphur to-day. Ans. Unigworm is exceedingly contagious, communicable from man to the lower animals and rice creat. Wash the part with soil-soap and water, and touch the part afflicted with a little strong accelie acid and en apply a little oil or lard.

then apply a little oil or latel.

D. E. M., Luzerne, Warren County, N. Y.—This morning, while looking over a batch of crawlish, I came across one which had 20 or 30 black halls about the size of No. 6 shot fastened to its abdomen. Are they its eggs, and if so, 40 they, in this stage, receive nourishment from the parent; How are they hatched naturally? Can I natch them, and I so, the best way? Also the best food for Can I hatch them, and if so, the best way? Also the best food for both young and old, its generic and specific anuse, and any other information which you can send about these miniature lobsters during the breeding time. Ans. They were probably its cggs, which do not receive nourishment, but are carried there until they hatch. The best way is simply to protect the mother, and she will care for the eggs and young. The name of the crawlish of your locality is Aslaves harbord. See our article on "How to Shuly Nature," in our last issue, and got the book on the craylish referred to. leferred to.

T. C., East Poultney, Vt .- I am a young man, twenty-four years of age, and am naturally fond of sport, and what I would like to know now is, could a fellow make a living hunting game, say during September and October. If I could I would get a pointer or setter and hunt where game is plenty, especially of the feathered tribe. Ans. If you are easting about for a permanent employment we should by all means advise you to learn a trade or to engage in some of the ordinary pursuits of industry. You cannot make a decent living by hunting; there are too many men cannot make a decent living by hunting; there are too many men trying to do that now. Stelk to your work if you have any; if you have not find something besides bird shooting. You are young yet, but even at the age of twenty-four you can ill afford to go off on any wild goose chases.

AMATEUR VIT.—I have a pointer puppy suffering from a humor, which I am consident is neither mange, surfit or smallpox. The cruption in its first stage consists of small red pustules about half

eruption in its first stage consists of smail for pusities about hair an inch part; these rapidly grow into ordinary looking primples or boils, and expand into what looks like water blisters the size of an old-fashioned three cent piece, and full of thick yellow matter. These pusities break, a scab forms, which comes off whole, taking the hair with it, leaving no scar or (as in smallpox) brown spot. The cruption is principally confined to the body and does not seem to cause any liching. The dog has a peculiar sickening odor, is feverish, very much depressed, bowch good and appetite fair. Any information will be gratefully received. Am g.ving the dog aconite and arsenic, homoepathically. Ans. Give two or

the dog meonite and arsenic, homoepathically. Ans, Give two or three drops of Fowler's solution of arsenic three times a day. Discontinue the aconite. Give two grains of quintine three times a day, and apply either sulphur ofintment or the following mixture externally: Powdered bicarbonato of potash, one ounce; powdered white vitriol, one quarter ounce; at subsulphur, two ounces; lard, eight ounces. Mix and rub well into skin. C. D. A., New York.—Your answer to C. J. C. prompts me to ask another-puestion of a similar nature. Under the head "Fish in Season," I formerly read "Land-locked Salmon, Solmo glovert." Now it is changed to Salmo solar, with nothing to distinguish it, from the true salmon. Has it only been ascertained, after all these years, that the two fish are identical, and is there really no such thing as land-locked salmon in a sense cultiling it to a name of its own? Ans. Girard described the land-locked salmon as Salmo glover, and thought the glover, and the such control of the control of the grain of t gloveri, supposing it to be a distinct species; and also thought he govers, supposing it to be distinct species; and also thought is found differences enough in some specimens from Sebago Lake to found another species upon, which be called S-schaye. Later naturalists consider them as only varieties of S-schay, and not different species. They differ only in color, and are simply the common salmon with its habits changed. If you have read the paper attentively you will see there have been changes in the fishery department, of which this is only one. The angler can see differences in color between the land-locked and common salmon, but zoillogists requires different structure to found a species.

### THE TILESTON MEMORIAL FUND.

Editor Forest and Stream :- New York, Sept. 3d.
I have to acknowledge the receipt to date of further subscrip-
tions to the "Tileston Memorial Fund" as follows: -
Previously acknowled         \$55 00         Jacob Pentz         \$5 00           A. S. Smith, through For- EST AND STREAM         DuBois Wagstaff         5 00           A Friend         5 00         Phœulx Reinsen         5 10           A Friend         5 00         John F, Vall         5 00
Total
We have named this late date as our treasurer (Mr. Morris) has

sectived notification from several clubs that they would send us subscriptions after the regular meetings, which take place this mouth, and we trust all parties who are making collections will send them in as soon as possible. Yours truly,

FRED. N. HALL, Secretary.

THE PENNSYLVANIA STATE TRIALS.—We had a very pleasant call this week from Mr. Theodore Morford, who expressed his regret that he had been obliged to decline the honor of serving as one of the judges at the Pennsylvania State Field Trials in November, he having previously arranged to officiate at Vincennes, Ind., for the National American Kennel Club's Field Trials, which occur on almost the same date

-The present number of the Forest and Stream is of special interest to anglers. Our next issue will be equally rich in material of great value to the shooting fraternity

-We conclude to-day the publication of "Englishe Dogges," a book which certainly deserves a place among bogges, a sour when teaching accented a place and the curiosities of sporting literature. Those who desire the work in more convenient form may secure the book by writing to "The Bazaar," 170 Strand, W. C., London.

#### THE TURBOT AND SOLE IN AMERICA.

PHILADELPHIA gentleman is trying, through the newspapers, to revive the long obsolete belief that the turbot and sole of Europe occur on our coast. Although he has never seen them himself, and fails to bring forward evidence that any one else has seen them, he insists that they occur in the greatest abundance in New Jersey, particularly in the vicinity of Atlantic City, "and doubtless all along the Atlantic coast, from Portsmouth, N. H., to Wilmington, S. C.," (sic). He upbraids the American public for their incredulity. though this does not surprise him so much when he calls to mind that "our Government Fish Commissioner has actually contemplated sending a steamer to English waters to procure turbot-seed to plantalong our shores, He would not be surprised if incredulity were to continue longer 'under such official indorsement.' He accounts for the ignorance regarding them by the theory that the English trawl-net is unknown in America, and that our fishermen would not know how to catch such fish if they were aware of their presence, and have not become aware of their presence because they have no means of catching them. He intimates that he is preparing to form a company for the purpose of developing a turbot fishery upon our coast an enterprise "in which but little will be risked and the results will be a surprise to all." He closes one of his letters to a New York journal with the following appeal: "I trust that you will not let this question subside, but persevere in calling attention to it until we do away with the extraordinary anomaly of this enlightened nation being within reach of treasure that for more than a century they have been unaware of, and have remained presistently blind to."

All this is very entertaining, and furnishes a neat text for a few remarks on the history of this belief as well as an opportunity for demonstrating to the public a fact which has for forty years or more been known to ichthyologists, that the turbot and the sole never have been seen on the Western side of the Atlantic, and never will be, unless they are introduced by artificial means,

From the beginning to the end we encounter the wellknown sources of confusion-the giving of old world names to species which resemble in a general way the old world species which bear them, and the unquestioning acceptance of these names as authoritative by persons who are not trained to close discrimination.

When Boston was occupied by the British during the revolutionary war, the officers of the fleet are said to have been bountifully supplied with turbot which were caught in the neighborhood of an outer harbor. This fact is re corded by Dr. J. B. C. Smith, in his Natural History of the Fisheries of Massachusetts (Boston, 1833), on the authority of William Ladd, Esq , Maine. He also mentions "a statement of Mr. Parker, the conductor of the Marine Telegraph," who told him that "many years before, Admiral Sir Isaac Coffin brought out to this coun try a trawl-net, such as are used on the coast of Holland. for taking sole for the London markets, with which he succeeded in capturing that delightful fish in Ipswich Bay, which was not before supposed to exist here." The fish found in this manner were no doubt the common flat fishes of Massacuhsetts Bay. The common flounder Pseudorhombus dentatus, taken in Provincetown water, where it is cominonly called "plaice," was in 1840 sold in Boston under the name "turbot." Capt. Mackinnon. of the Royal Navy, who visited this country in 1850, conceived the idea that turbot ought to be found on the shores of the United States, and took pains to search for them with a trawl-net. The net which he used has been reported ten years before by Mr. Nathan Smith, an American gentleman, who had hoped to introduce them. but had never used them. Capt. Mackinnon tried the net at Newport, R. I., and succeeded in taking a number of different kinds of flat fish. He carefully refrains, how ever, from pronouncing any one of them to be identical with the turbot or the sole, though from the vagueness of his language it is evident that his ichthyological knowledge was very scanty, and that he was not accustomed to observe the differences between the different species of

fishes which somewhat resemble each other. His experences are described at length in his book of travels, entitled "Atlantic and Trans-Atlantic Sketches, Affoat and Ashore," (Harper & Bros., New York, 1852, pp. 166-1 0'. Capt. C. C. Churchill, U. S. A., who saw the results of Capt. Mackinnon's experiment, tells us that the fish taken were the common species of New England flut fishes and flounders.

We fancy that the inspiration of the new advocate of the turbot-in-America question, as well as the information upon which he bases his conclusions, were drawn from this very same book of Capt. Mackinnon, for he uses many of the same phrases, and he repeats in almost the same words Capt. Mackinnon's statement: "The fish markets in America are not at all in keeping with the size and wealth of the cities." A statement which, how-ever true it may have been thirty years ago, will be amusing to any one who has recently had opportunity to compare the fish markets of America and Europe. Philadelphia gentleman sums up his evidence as follows: "The turbot, sole and plaice are, however, in abundance in your deep water sand banks. They were caught there in 1812 by English sailors, and in 1880 turbot have been obtained off Atlantic City, if the Baltimore American is any authority.

The notion that the introduction of the English trawl in America would be novel and would at once open up a field for a fishery industry of boundless extent, deserves a word. The trawl has been assiduously used by the summer collecting party of the United States Fish Commission for ten years past, and also by Prof. Agassiz upon various exploring trips. The steamers of the fish commission have used it on every portion of the New England coast, and as far north as Halifax. Prof. Agass z has used it in the Gulf of Mexico and on the coast of Florida, and during the present summer, while on the coast survey steamer Bache, has employed it in running five lines of research at right angles to the coast from Cape Hatteras at points nearly equidistant between Charleston and Cape Cod, one of them directly out from the entrance to Delaware Bay. These lines were carried from near the shore to a depth of twelve hundred fathoms or

In 1854 Prof. Baird made a careful exploration of the coast of New Jersey with a special reference to the fishes, and since that time every stretch of coast line from Brownsville, Texas, to Eastport, Maine, has been thoroughly investigated by the officers of the United States Fish Commission. It is true that a new species of fish is occasionally discovered, but the new fishes always belong to one or two classes. These are either swift-swimming species, members of the West India fauna, which come upon our northern shores in summer, or they are inhabitants of waters more than six hundred feet deep which had never previously been explored. The turbot and the sole are shallow water species, and had they occurred in our waters would have been discovered many years ago.

There are thirteen species of flat fishes on the eastern coast of the United States. Two of these belong to the same family with the sole, but are utterly worthless as articles of food. The nearest relative of the sole is often called the American sole (Achirus lineatus), and is known on the coast of New Jersey as the "hog-choker," "coverclip," or "cover." Of the eleven flat fishes, only two are positively unfit for food, and these two, strangely enough, are the representatives of the sub family (Rhombinas) to which belong the turbot and brill of Europe. One of these (Lophopsetta maculata) is sometimes called the "spotted turbot," and in New Jersey is called "windowpane" or "daylight," because it is so thin that when held to the light the sun can be seen through its translucent flesh. The most important flat fish is the halibut, which is identical with that of Europe. This species and the pole flounder, which has recently been brought to light in our waters by the Fish Commission, are the only two of the thirteen referred to that are found on both sides of the Atlantic. We have in our waters an abundance of flat fish, some of which, for instance, the common flounder of the New York market, Pseudorhombus dentatus, are probably fully equal to the turbot for food

uses. In fact it may be had in the New York restaurants and hotels under this name. Another fish, Platysomat-"chthys' hippoglossoides, resembling the turbot in flavor. is sometimes brought to New York in winter. It is found at great depths on the coast of Newfoundland, and is often called the "American" or the " Newfoundland Turbot." The pole flounder is very similar to the sole in flavor and in the texture of its flesh, but it unfortunately inhabits somewhat inaccessible localities at great depths, and it is hardly to be expected that, with the present supply of excellent food-fish to be obtained at so much smaller expense, our fishermen will take the pains to go in search of them. That the popular taste for flat fish is already well cultivated, is shown by the fact that in 1879 1,796,000 pounds were sold in New York alone.

It is needless to refer to the efforts of the United States Fish Commission to introduce sole; they are familiar to all who are interested in the subject. The introduction of the trawl-net has been for many years under consideration, but this expensive mode of fishing does not seem to be required at present, since the supply of fine flavored food-fishes is more than equal to the de mand. With an eye to the interests of the American fisherman, Prof. Baird has recently detailed an attaché of the Fish Commission, one of the most experienced fishermen of Massachusetts, to study the trawl fishery in the German Ocean, and his report will soon be published.

Finally, it may not be amiss to state that Mr. E. G. Blackford, of Fulton Market, New York, has for some time been authorized by the Commissioner of Fisheries to pay twenty-five dollars to any one who should present a true turbot or a true sole caught on this coast. This offer is still standing, and our Philadelphia friend may thus obtain fifty dollars of his required capital by capturing a specimen of each and calling upon Mr. Blackford, which we hope he will do before he addresses the public again upon a question which he does not understand.

#### FISH IN SEASON.

So many inquiries have lately appeared concerning our published list of fishes in season, and our changes in the scientific nomenclature of some of them, that we have given the list a thorough revision, and invite criticism upon it. We deem it necessary at this time to go over the list of common names and make some explanations, lest anglers who use another name for one of them may think their favorite fish is left out. Beginning at the top with those known to have an alias, we will say of the lake trout that this is also called salmon trout, a name applied to several fishes. Pickerel (a diminutive of pike)-this fish is known in the Eastern States by this name, and is not found except in the Atlantic streams and the lakes. Pike-by this is meant the great pike, so called in Europe and America, except New York, where it is confounded with the smaller one above. Pike perch is the miscalled "salmon" of the Susquehanna, Mississippi, Ohio and other Western and Southern rivers. the Lucioperca of Cuvier and angling authors, the walleyed pike of New York. Yellow perch is the barred perch, raccoon ch, etc., of the South.

Striped bass-the reckfish or rock of Philadelphia and the South White bass is the striped lake bass of the Great Lakes and upper Mississippi. Rock bass is also called red-eye and black sunfish in different localities; there are two species, A. rupestris and A. cavifrons; the common name seems to be applied to other fishes. They are called black bass in some places, because they are really blacker than the fish usually so-called. Warmouth-a fish somewhat resembling the above, found in the Southern States. Crappie—the grass bass, strawberry bass, chinkapin perch, speckled hen, etc. clor-so-called in Ohio, the newlight of Kentucky, and crappie or croppie of the lower Mississippi. Chub-only the large cyprinoid, growing to half a pound weight, is meant; it is also called fall fish.

In the salt water list the porgie is the scup of Massachusetts and the East. Tautog is the blackfish of New York. Sea trout, or salt water trout, is the name given to what is known as Southern weakfish in the New York market. Weafish is the squetague of the East and the salt water trout of Washington and the South. Bluefish is called taylor south of New Jersey, and snapping mackerel when young; called also horse mackerel. Kingfishcalled barb in New Jersey and whiting South.

It will be seen that it is no easy task to know what fishes are meant by writers of different sections, who often use one name for different fishes, or have many names for the same species. Nor is it easy for us, cosmopolitan as we are, to select a common name for some of them which have many. In making our list we have been guided by general usage as obtains in the great markets, except in the case of pickerel for the great pike, which we consider a gross blunder.

At the National Fair, to be held at Washington, Oct. 5th to 15th, three classes will be provided for the exhibition of dogs, guns and food fishes. Full provision is made for the protests of exhibitors, and the best of facilities offered for working up a national dog show cause celebre.

#### A DISGRACE TO THE RIFLE WORLD.

\* HAT wretched Halford-Hyde match seems destined to keep up its stench in the nostrils of riflemen for some time to come. Not content with making himself ridiculous in the eyes of all America and with a persistent stupidity rushing on to a defeat which was foreseen by all but himself, the gun-agent author of that match has now turned letter writer, and cropping up here and there are explanations, extenuations and lame apologies for his disgraceful defeat. There is not enough sportsman about him to say with a manly frankness: "I am beaten, better luck next time." will not give the British team the credit for the fair, square set-back which they seem to have given him, but instead a black streak of the match is dragging its slow length along in the daily press, while Mr. Hyde is gradually entangling himself in the web of his own excuses. The fact simply is, that by hook or crook he succeeded in inveigling a number of good shots into his company, and when pitted against the British team he and they were ignominiously beaten. The why and wherefore is plain to any but the most prejudiced and blinded apprehension. The team was woefully mismanaged, and as a consequence defeat came upon it. All of this could be endured. It might be explained as the error of overenthusiasm, that the manager of the match, overconfident in the ability of the American riflemen, had miscalculated and had forgotten that even the flectest runner may stumble and fall. For the vileness of the letter-writing sequel no such excuse can be offered. The letters thus far written are more spiteful attempts at re taliation like that of a "whipped cur" who turns and snarls at those who will not stop and caress it.

To come to particulars, in one of his explanatory letters, Hyde says of a member of the genuine American

Dentist Clark is, in a great measure, responsible for the defeat. He was one of the original team, pledged to it long before the Irish match was thought of, as I have his letters to show, and was, in fact, the only one of all the riflemen of America who came to me and asked for a chance to shoot in this match. He pledged himself anew at Dublin, after the Irish match, and up to the day before the match we had every expectation he would shoot. Then we learned that he, passing in sight of Wimbledon without visiting it (fancy a genuine ritleman doing that) had turned tail, like a whipped cur, and tled to America with his

And again, in another letter, he speaks of the same gentleman :-

It was this opposition, coupled, perhaps, with a glowing pros-pect of being "received" at New York with Col. Bodine, that caused Clark to run away, and it was his non-appearance un-questionably that caused Farrow's defection, as rats leaving a sinking ship: either that, or the explanation is to be found in the smann snip; either that, or the expanation is to be routed in the fact that the be-ting was two to one on the American team up to the morning of the match. His nominal excuse was that he had been unjustly deprived of a barrel of his favorite tipple. It is fair to assume that, had, Clark remained, Farrow would not have that to assume that had clark remained, rarrow would be assold out or deserted—whichever it was and that they would have made the average of the other six (202), and that their help to the others, and the absence of any "squabble," would have added five points per man all around, and consequently have won the match.

Messrs Farrow and Clark were free to act as they chose in the matter, but preferred taking their counsel from the members of the National Rifle Association. is, indeed, poor logic to say that had the membership been stronger than it was, the team had never been beaten. That goes without saying. The team was strong enough to do better work, and but for its wretched handling it would have made a more creditable showing.

The hints and slurs in the above quotation are beneath notice, and should have their proper effect in barring their author from every ritle range in America. The gambling explanation of the absence of Mr. Farrow may be a reflex from the mind of the writer. This certainly is a fair view to take of it, when the facts of this match and the utterances of the letters are brought together.

TWENTY-THREE MILES AN HOUR .- This is in round numbers the speed attained by a new torpedo launch, of only sixty feet in length, just completed for the Russian government, particulars of which will be found in another column. We have all along held that under the Herreshoff system a higher rate of speed could be obtained than from any other practice, and the successful trial of the new launch substantiates the correctness of our views. With their wonderful light but tough hulls, their light and efficient coil boiler, and the matchless proportions of their engines, it would not be astonishing to see full twenty-five miles an hour turned out from the famous Bristol yard before another year rolls around.

PROFESSOR JORDAN.-We are pleased to hear that Prof. D. L. Jordan, the able ichthyologist and Assistant of the United States Fish Commission, has returned from his labors on the Pacific coast, and is once more at his home engaged in his long promised synopsis of salt water fishes, which was begun some two years ago, but postponed on account of a pressure of other work. He has added greatly to the knowledge of the fishes of the Pacific coast within the past year, and has sent several tons of new species to the Smithsonian Institution.

---

#### FROM THE WATER TO THE FIRE.

HE was a famous fellow, as well known to the frequenters of the streams as any of the most prominent landmarks upon it, and right merrily had he led the dance for more than one angler. He was no unsophisticated trout, but a consumnate master of foraging and skirmishing, and for cunningness and resources a worthy compeer of the heathen Chinee, and although he had had many a narrow escape to recount to his companions he had so far managed to free himself from the most intricate meshes into which his appetite had lured him. More than one leader with its cast of flies had disappeared in that whirling eddy. He was the hero of many an evening yarn spun by the camp fire, and although never more than a momentary glimpse had ever been seen of him his weight was known to an ounce.

The pool where he made his headquarters was chosen with the skill of a military engineer, inasmuch as it was a natural fortification. On one side where the water was blackest and portentious of unknown depths was a precipitous bank, up or down which no one could climb with his fishing tackle in fighting order. The opposite side, a dense mass of fallen trees, the branches of which reached half way across the stream and furnished convenient hitching posts, around which his troutship could wind a leader escape at his leisure. The water whirled to the left and fretted itself into foam-capped disorder and broke its head against some boulders and then quietly went to slumber in the black pool below. This fish lay on the edge of the swirl and could only be reached from above, and if reached he had invariably unmuzzled himself by managing to effect a junction with the fallen tree tops, His first rush after feeling the hook had always been in that direction, and how to prevent it without taking an unfair advantage of him was a puzzle, but there was an avenging Nemesis on his track who was destined to solve the problem.

A leader of extra strength was rigged with two yellow professors and a Montreal fly, and at the third cast the middle fly, a professor, was fast to the old grandee of the pool. A silvery streak flashed in the sunlight, flashed but an instant as he made his first break, and was away like an arrow toward his old allies, the tree tops, the rapid current adding momentum to his run and making the reel fairly hum. He was an incalescent desperado. The manner of his leave-taking proved it. A fellow less in earnest, with less demoniacal energy, would have given up and made no flurry about it. Not so this one, His preliminary rush was whiz-z-z-z, and it was merely supplementary to the other maneuvers he displayed before we were on speaking terms. Whiz-z-z-z-z! the most exhilarating music that ever tickled the tympanum There was a commotion all around that vicinity. Away he went as though he had forgotten something. He's the Old Scratch himself let loose. A nervous man would say better unhitch an African simoon or a North American tornado. But the elastic rod, steady and unrelenting, snubbed him smartly as he headed for the tree-tops and checked every rush in the nick of time.

That particular trout was fenced in ; in fact, cornered. He had never before entered into a speculation in which the profit promised so small a return for his investment. He would willingly have settled for ninetynine cents on the dollar, but his principal creditor was inexorable in his demands, and would accede only to a settlement in full.

Great Scott! but he fights just as a man does when he is driven into a corner and knows he must strike heavy and quick or take a "licking," and perhaps get it any-Inch by inch, foot by foot, he comes. landing net; so-o-o-o. Oh, Piscator! by all the powers, well done! My eyes, what a beauty-purple, silver and gold-resplendent as a tropical sunset; weight, four pounds fifteen ounces. We might call him an even five pounder, but that would be lying for an ounce, and we are no light-weight liars.

What a splendid fellow he is, to be sure, considered resthetically. The stream, from its source to its de-bouchment, contains no finer. The pulse-tingling excitement you have just experienced speaks of his prowess, and to-night's supper will tell of his succulent obesity, fit for the palate of Sardanapalus, or for the gullet of the most fastidious tramp that ever tapped at the kitchen

What an ignoble end of a happy life! Brought up in the purest surroundings, with never a care to trouble, all wants lavishly supplied, growing more and more beautiful as the seasons advance, until he develops into that prince of swimming things, the perfect trout, and then in his overweening confidence in his own prowess the bubble of his pride is pricked; he falls from his high estate, and ends by sizzling on a broiler. MILLARD.

THE CREEDMOOR FALL MEETING .- By the date of our next issue the range at Creedmoor will be in active use with the matches of the eighth annual fall meeting. Already there is prospect of a good attendance of marks-men, while by teams a large number of organizations will be represented. The regular army is coming for-

ward with an energy quite noteworthy, and each team sent on to compete represents an amount of practice which would have been deemed extravagant five years The States are also falling into line, and the New York team will find competitors from Pennsylvania, New Jersey, California, and, perhaps, several other States. Massachusetts and Connecticut should certainly come. There is a prospect of some fine, close work in the offhand matches, where many excellent clubs will be pitted against each other. Col. Bodine the executive officer. has been making preparation for a prompt shooting off of all competitions, and an abundance of shooting will be provided at the bullseye targets for general practice, and for the filling up of odd moments during the several days of the meeting. All who come and participate at the meeting may depend upon accurate marking and a fair opportunity to show their ability. Compared with such a meeting as that at Wimbledon, the Creedmoor gathering takes on a very modest aspect as to size and general stir, but when the records are compared the comparison is vastly in favor of the American range. In the several classes of short range, long range, and in military shooting, there is no danger that the work of this year will fall below the average. On all the smaller ranges good work has been doing, and the spirit of rivalry is strong enough to bring out the best work, independent

TATHAM'S TRAP SHOT .- As many of our readers may not know the new trap shot, advertised by Messrs Tatham Brothers, it seems proper to give them a brief explanation of the new article. This shot is numbered from 7 to 10, each number being one-half size smaller than the ordinary shot of the same number. The peculiar feature of the trap shot is its almost absolute evenness of size, and it is confidently asserted that the number of pellets to the ounce will not vary more than four or five either way from the number which an ounce The manufacturers are so well satisfied should contain. that they have attained this evenness of size that they stamp upon the bags the number of pellets that there should be in each ounce, so that any one who purchases it may count it for himself and see how closely it agrees with the standard. Such a shot as this is just what should be used in gun trials, and there is no doubt that at game it will give better results than their old fashioned make.

in large measure of the prize list.

THE IDENTIFICATION OF FISHES.—We wish to call the particular attention of those who, having never paid attention to the structure of fishes, claim to identify them, to our letter from Alaska. Here is a case which points its moral. "Piseco" is a veteran trout angler and a close observer; also has the advantage of years of contact with the first ichthyologists of the world, and has im-bibed much of their lore, so much that we would prefer his judgment on a fish to that of any mere angler. he was mistaken in supposing that he had found an Eastern brook trout in Alaska-a fontinglis-as his fish was marked so like the ones which he knew so well by sight; but he did not happen to know that the presence or ab sence of teeth upon the hyoid bone (the bone which supports the tongue) was an all-important factor in the diagnosis, until Dr. Bean, one of the celebrated ichthyologists of the Smithsonian Institution and the Fish Commiss came along and rectified his mistake, which he so gracefully acknowledges in his present letter.

We make this comment to show how easy it is to be mistaken, and why we are sometimes skeptical about fishes which are positively asserted to be "genuine" brook trout or black bass when we do not know the ichthyological attainments of the writer, who, by the way, is usually positive in proportion to his ignorance of structure; and the error acknowledged by "Piseco" should be treasured up by all. Having learned a new and valuable lesson himself, our accomplished Alaska correspondent wishes to enlighten his brother angler sand share his knowledge,

DICK, THE WOODCOCK .- The correspondent who writes to inquire about the tame woodcock is referred for full particulars to recent issues of Forest and Stream. Better than reading about the bird is seeing him, and we recommend those who are interested to call on Mr. Morris at 17 Jefferson Market and see his pet. Dick will be found in the greenhouse surrounded by flowers, and with dozens of feathered companions of different kinds. His owner, in addition to his business of florist, has a number of birds, most of them native, though canaries, sky larks and other foreign song birds are to be found at his We noticed, during a recent visit, young robins, bluebirds, catbirds and cardinal grosbeak, all of which seemed to be doing well.

FROM THE ENDS OF THE EARTH,-The FOREST AND STREAM draws its good things from the uttermost parts of the globe. To-day we publish letters from Alaska and from South Africa.

WILD RICE.—Wild rice may be obtained this season in good supply and quality from Richard Valentine, Janes-ville, Wis., and Chas. Gilchrist, of Harwood, Ont. We shall shortly publish full directions for the sowing of the

SNOEK FISHING IN TABLE BAY.

BY E. B. BIGGAR.

THE glorious Southern Cross gleams brightly from above the broad top of Table Mountain and there is searcely a sign of dawn as the rumbling of boat-oars announces that the fishermen of Capetown are beginning their day's toils. If the reader will, let him accompany me with one of the snoels boats that are now preparing to enter the waters of Table Bay. The fishermen whom I ask for permission to go with them cheerfully grant the request. They are not the tall, light-haired, wiry-looking men to be found on the Atlantic Coast of America, but the dayk and dreamy fisher of the Eastern sees, with

request. They are not the tall, light-haired, wiry-looking men to be found on the Atlantic Coast of America, but the dark and dreamy fisher of the Eastern seas, with such Oriental names as Abdol. Apollis and Makmoot. Our boat issues from a little, narrow-beached, ill-savored cove, called Rogge Bay, sheltered by a primitive pier at the foot of the leading street in Capetown. The coarse, low-toned, booming voice of some boat-hand echoes strangely against the silent town and over the bay as we move off over its silent surface, boat by boat, like some black specters over a sea of death. On my remarking at the stillness of the broad bay, the fishermen hint that before we are ashore we will have enough of an opposite extreme. Passing out slowly from the gloom of the grand old mountain, we are at length behind the Lion's Rump, with Robben Island stretching long and low on our right and Green Point Beach, under the Rump, on our left, with the surf rolling solemnly on its rugged shore. The stars, which have been shining with a brilliancy unknown to the gazers of northern climes, begin to pale in the dawn and day lastily approaches, glorified in tints which I cannot attempt to picture with pen. The slightest haze is all there appears to be of fog over sea or land this morning—for clear air is the wonderful feature of these latitudes—and the temperature, which at first was only moderately cool, is soon quite genial. In the broad day tean now tell you what my crew are like while they these latitudes—and the temperature, which at first was only moderately cool, is soon quite genial. In the broad day I can now tell you what my crew are like while they are settling themselves to work. Abdol is a middle-statured, sack-coated, barefooted, olive-complexioned, aquiline-nosed, thin bearded and wrinkled man. He bears a name of Arabian odor and his appearance might bear out the character; but he is a Malay, the son or grandson of some slave brought from that country by the old Dutch settlers of a hundred years ago. Apollis is hardly the god-like, graceful being you have already fancied, but a stout-bodied, big, barefooted man, with a face like the "full rounded moon" in shape, but densely eclipsed and swelled as by the refractive effects of a dim

grandson of some slave brought from that country by the old butch settlers of a hundred years ago. Apolitics is hardly the god-like, graceful being you have already fancied, but a stout-bodied, hig, barefooted man, with a face like the "full rounded moon" in shape, but densely eclipsed and swelled as by the refractive effects of a dim horizon. As a peculiar savor hints, this exaggeration is produced by the excessive use of Cape beer. Possibly from the same cause his voice is horse and coarse. Apollis is an African—one of his parents from Zanzibar, the other a Cape negro. Makmoot—well, his nationality is a moot question. He is dark in color, though not black. He has a name of Arabic pronunciation, speaks the Dutch language, wears English clothes and an African countenance, professes the Mohammedan religion, keeps the Christian Sabbath and sends his children to Sunday-School, yet is known as a Malay.

Makmoot lifts his coil of line, and fixing the bait to his trolling hook, tosses it over the side. We are now about half a mile off from shore, between those beautiful mountains of Lion's Runup and Lion's Head, and are making toward the open sea. The breeze is not favorable for trolling, for the Provadence (with an a) hardly moves under her small spanker. Yet the line has scarcely been dropped in the water before it is jerked taut. Apollis in the meanwhile pulls a small baton from beneath a thwart and hands it to Makmoot.

"What is he going to do with the club?"

Master watt—see," replies Abdol, who, I should remark, is the commander and owner of this craft, allowing certain shares of the day's take to each of his mates. It took but a minute to explain the use of the baton water, gives it a toss which lands it high and close under his left arm. It is hardly lodged in this position before the baton is swung around and brought down with charming destrity on the fish with gleeful adroitness out of water, gives it a toss which lands it high and close under his left arm. It is hardly lodged in this position before the ba

again. Apollis, with less skill and no small bluster, again. Aponis, with fees skill and no small bilister hails away, causing the boat to lurch, and dealing his victim a fearful blow, throws him down with savage triumph, in wide and rather interesting contrast to the polished style of Abdol, who now again unconscious of his high art adds another to the number in the bort. A polished style of Abdol, who now again unconscious of his high art adds another to the number in the boat. A gently stiffening breeze from seaward increases our rate of speed and attracts the fish in quicker succession. The fun is furious. The tightening line, the thrashing of the water and the thump of the club followed each other so fast that the fishers themselves laugh and congratulate each other upon the run. Evidently it is rather an inusual fortune, for after a time there is a sudden rest. I ask if this is the capricious nature of snock, and Abdol replies by suggesting that if I will bear off again from the shore we will run faster and catch more fish, whereat Makmoot and Apollis laugh. I awake to the fact that I have nuconsciously, while so intent upon the fun, allowed the boat to run up into the wind and lose way. Thus I had to pay the penalty of want of attention to my duty. However, we get under way again, and the takes are tolerably numerous, though never so lively as before. I had now watched the magic trick till I had, point by point, taken in a pretty correct idea of the whole modus operandi, and I said: "Abdol, hold this tiller till I try my hand."

"Master want to catch snock?"

"Yes."

I threw the line out, and it was some time before I cot.

my hand,

"Master want to catch snoek?"

"Yes."

I threw the line out, and it was some time before I got a bite. Then I jerked in with a style hardly so graceful as Adolfs, and after some lurching of the boat, I god him above water. Then I performed the swing under my arm: he struck the right spot exactly. I ruised my club and—struck my arm a blow sufficient to have stunned a whale, much less a snoek. But I think I must have hit the snoek—somewhere about the tail perhaps. However, he fell outside the boat and shot like a glesm through the water. "There," thought I, "goes the line, hook and all." But Adold had fortunately tied the end in the row-lock, and he was brought to a check soon enough. I hauled him up, and scorning the amplitrick, decided to dispatch him in my own way. So I god him down against the side of the boat and made a stab with the end of the baton. I made an impression in one of the ribs, but none on the snoek, for he was at that moment floundering over the corpses of his fellow creatures in the other end of the boat. By the time I had recovered for another effort of skill, I saw him lie still for a moment. Now, I thought, is my time, so I aimed a shot of a horriby fatal nature at his head. The baton bounded over a thwart and went whirling like a boomerang off toward the equator. This is a somewhat exaggerated account, but at all events I did not kill the snoek, and Abdol, mencifully robbing me of any revenge, lifted him up and dispatched him with a single tap. I resumed the tiller. After all—I consoled myself—snoeic catching is not an elevated pastime; it is only fit for the cunning sleight of some magic-working Oriental.

At about II oclock our boat is about two-thirds full and Abdol considers it time to return, for a southeaster is likely to spring up.

At about II oclock our boat is about two-thirds full and Abdol considers it time to return, for a southeaster is likely to spring up. Though now a considerable distance off we make good headway in, and while we go a lunch is brought out, consisting of fried snock and bread, and is eaten with eager appetites. The crew meantime conduct their conversation in barbarous Dutch, and I fancy from their pleasantry that the subject of the conversation is a certain incident of the day. As we round Green Point toward the docks of the town, a white clond gathers in a clear sky over the brow of Table Mountain, and that is the herald of the southeaster, which even before we reach Rogge Bay is lashing the water into white cups, And now the "sport" of the day is done: if the reader wishes to hear nothing close he may stop here, but if a few facts on the business aspect of the question will interest him he may read to the end.

Preceding and following us to and from the cove was

wisnes to hear nothing eise he may stop here, but it a few facts on the business aspect of the question will interest him he may read to the end.

Preceding and following us to and from the cove was a fleet of some thirty boats, all precisely like our own in size and appearance, manned by crews equally varied in race and color, and engaged in the same business. As I stand on the beach watching them come in I securery boat has, what seems to me, a profitable load, some less than half full, others loaded almost to the gunwale. Each boat is welcomed by a crowd of chattering humanity of every continent, nationality, tribe, kindred and tongue, and perhaps the least cultivated and refined of each class. The boat is pulled up and its load removed up the strand, each fish being taken by the head in removal. As I sec colored servant girls carrying an occasional fish home carefully in the same way, I now learn the reason why the fish is killed on being caught. The flesh is not only of fine grain, but exceedingly tender, so much so that where a slight bruise has raken place the bruised part if fried after a day or so will goall into meal like fine mashed potatoes. Such portions putrify sooner than others. If the fish were left to die in the boat its thrashing about would spoil the flesh, hence the process of clubbing. Along one side of the strand are rows of benches. Here stand the cleanors—some men, some women—and the facility with which they prepare a fish is admirable. From a basket on his left he lifts the fish and severs the heal; then, with a careful though quick curving movement of the kinfe, open out the entrails, which fall out clean and easily, and with a lightning stroke draws the kinfe from head to tail, and the red flesh of the snock is opened out into two broad, rich halves, and thrown into another basket, done. The baskets are then taken to the "lisk kraals," or drying sheds, where, under the influence of a dry atmosphere and a warm sun, they rapidly dry, having been salted. Others are smoked dry, and these though deater, are beening much extensive, as eacy deserve to be. On the beach a snock will sell at from two pence (four cents) to eight pence, according to the season; a dried snock at about ist pence, and a snoked one at eight pence to a shilling and three pence. The supply in the sea here seems exhaustless, and the snock can be caught all the year round, though from October to January they are few in number, poor in quality, and often have white worms or grutos in the flesh. These worms are considered poisonous, though the fishermen eat the fish at this season as throughout the other parts of the year. While the market here is large, snock are caught in equally large quantities on the other side of the peninsula, in the waters of False Bay, Simon's Bay and Kalk Bay. What is done with them? Well, at one time they were considered fit food only for the poorest colored people; now they are largely consumed in the

inland districts of the colony by the white classes. They are also exported interior to the Diamond Fields, to Natal and to the island of Mauritius, where they are chiefly consum d by the crolles, or East Indian laborers, who are employed on the sugar plantations of the island. They are a cheap food, and being very tender when dried or smoked, are palatable and better suited to the stomach in a warm climate, where strong meats are injurious. Such are a few notes concerning snock catching at the Cape of Good Hope.

ANIMALS OF THE MOUNTAINS OF NORTH CARO-LINA AND TENNESSEE,

ARIMALS OF THE MOUNTAINS OF NORTH CAROLINA ARD TENNESSEE.

Editor Forest and Stream:—

In the summer of 1888 I explored the mountains of North Carolina and Tennessee, botanizing and measuring their heights with barometers. In the March (1889) number of the American Journal of Science is an article from me about these mountains. As the Journal has a small circulation, I give the following extracts from the article:

"The tedium of the night, when encamping on the mountains, is amost always enlivened by the stories of the guides of their adventures in hunting. They all positively assert that the bears in early spring, when first emerging from their winter quarters, are as fat as when they first reture for the winter. During the winter they shad the soles of their feet, which renders their walking difficult in the first spring. Then their food consists of young plants, on which diet they soon become lean, and remain so until the ripening of berries in August and September. They are very fond of hogs and pigs, pork and honey being their favorite diet. Why they bite and scratch the bark and limbs of the balsam and black spruce, I cannot tell. It cannot be for food, because they do not generally leave the marks of their tech on a tree except in one or two places. Sometimes they rise on their bind legs and make long, deep scratches in the bark with their forepaws. It may be done for sport, or to let their companions know their whereabouts. We have seen these fresh bites and scratches on different trees during the entire warm season. The bears show great sagacity in feeding to the leevard of the paths of the nountain ridges, along which the hunter is almost obliged to travel; hence, if the wind blows, it is almost impossible to get a shot at them, their keen scent discovering the hunter los pletore he gets within shooting dis obliged to travel; hence, if the wind blows, it is almost impossible to get a shot at them, their keen scent discovering the hunter long before he gets within shooting distance. They are stupid and unwary about traps, entering without fear the log pens, which are shallow, with a depth of not more than two feet, over which is raised a very heavy top, which falls and crushes the bear when he disturbs the bait. Hundreds are caught in this manner every year. In the unfrequented parts of the mountains the large steel trap is concealed in the bear trail; but this is dangerous, and liable to catch dogs, of which we saw two crught in one morning to our great sorrow. but this is dangerous, and habe to catch dogs, of which we saw two crught in one morning to our great sorrow. The pitcous yells of these dogs rang in our ears long afterward. The bears rarely disturb calves or young cattle, but in one locality of the Smoky Mountains we were told that they did much damage in killing young cattle, and that there could be no mistake about it, because a large bear had been caught in the act of killing a young

steer,

'The panther, wild cat and wolf are all troul lesome to The partner, who car and woir are all trout lessme to the mountain farmer of these regions. The parther de-stroys sheep and hogs; the wild cat, lambs and pigs. Both are cowardly and thievish, being rarely seen. "The red squirrel (Sciurus hudsontus), called mountain

"The red squirrel (Scienres hadronus), called mountain buma in North Carolina, is common in all the higher mountains. It rarely descends into the valleys. It is fond of the sceds of the balsam and black spruce (Abies fraseri and nigra), and as it is rarely molested by the hunters it is very noisy, active and fearless of man. "We were told by a traveling four merchant whom we met that the skins which he bought among the mountains equal in fineness and goodness those of the North, and that Northern merchants could not tell the difference; still, in order to get the highest price, he was obliged to send his skins to New York through Ohio, via the Erie Railroad, as if they had come from the Northewest. The principal furs obtained in the southern Alleghanies are the skins of the otter, mink, black fox, red fox, raccoon and muskrat."

To the above extracts let me add that twenty years ago trout and deer were abundant in those mountains and

To the above extracts for me and that twenty years ago trout and deer were abundant in those mountains and streams; that twenty-four of their peaks are higher than Mount Washington; that they have finer and grander scenery than any other portion of the Appalachians extending northward to Canada. Also, there is another very important item in favor of the Southern mountains as a whose of resystemment of the property of the southern mountains. important tent in Tavor of the Southern mountains as a place of resort—mosquitos and guats are not there to torment one, as in Maine, Canada and Minnesota. The valleys are from one to three thousand feet above the sea; hence these mountains and valleys have a Northern climate. On many of the higher mountains I found species of plants which I had previously seen on Mount Washington, in New Hampshire.

Austin, Texas, Aug. 16th.

Editor Forest and Stream :-

Editor Forest and Stream:—
In a late number of your paper, you referred to the question of the best breed of dogs for hunting bears.
On the map of North Carolina, in Macon County, may be observed a place called Aquone, in the western portion of the State. This little village of three or four houses, with a post-office, 2,600 feet above the sea, and seventy miles from a railroad, lies at the base of two ranges of high mountains, the Nautibela on the east, and the Valley Mountain on the west. The surrounding country, being thickly wooded and thinly settled, abounds with many varieties of game, such as bears, panthers, deer, wild turkey, etc., which are hunted only with difficulty, as the mountains are steep and lotty.
At Aquone lives Alec Mundy, a man as well known for his genial, social qualities, as for his proficiency in hunting. I have had the pleasure of enjoying Al-o's hospitality on four occasions, when passing through that lonely mountain country, as he lives on the road leading

from Cleaveland, Tenn., via Ducktown, to Asheville, N. C. His favorite sport is bear hunting, and he keeps two well-trained dogs for that purpose. On the last occasion when I was there, he told me that dogs then in his possession had assisted him in killing more than twenty bears. Through him I told me that dogs then in his possession bad assisted him in killing more than twenty bears. Through him I some mountains the bears usually reden up," and the countries of the purpose out again about the 20th of April, when a particular plant is large enough for them to early in January, and come out again about the 20th of April, when a particular plant is large enough for them to early with the purge themselves. They are fat when they "feed on acorns and chestunts. A fat bear soon comes "to bay," but a lean bear runs like a deer and "makes" for the mearest precipice, either to sseend or descend in order to escape from the dogs. When descending, they double up and roll down. Alec says his dogs can find a bear any day in season. When they overtake one, each dog assumes his position, one on each side of their enemy. Dog No. I seizes a thigh of the bear, which immediately turns to fight it off. No. I lets go contemporaneously with a bite from No. 2 on the other thigh. Bear turns with rage to No. 2, which lets go synchronously with another bite from No. 1. In this manner bruin is entertained until Alec comes up on horseback, dismounts at some distance, then approaches quite near with his shot gun, which he perfers to a rifle. On several occasions, when a bear was wounded, it rushed at him with purposes not peaceful, and he might have been killed, but his faithful dogs, apparently knowing the danger to their master, seized the bear by the thigh, and diverted its attention long enough for Afec to reload his gun and fire again. Alec says the requirements of a good bear dog should be courage to attack, and cowardice to let go when the bear attempts to seize it. He states that a cross between a buildog and foxhound mets the case

#### HERONS AND CORMORANTS.

N the 21st day of August, the present year, I was in heavy, tall timber in the Illinois River bottom, twenty-five miles above Peoria, bee hunting, when I was surprised to find myself in the midst of a large nesting place of the great blue heron (Ardea herodias) and little white egret or snowy heron (Ardea cantidissima) in about equal numbers, and with a few nests occupied by the two young to a nest of either the double created cormorant (Graculus dilophus) or the Mexican cormorant (Graculus dilophus) or the factor of the same in every way, and I should judge, or rather guess, that the cormorants had dispossessed the herons of their nests, or at least occupied an old nest from the beginning of the season, for it is hardly reasonable that birds of such very different characters would build nests exactly alike, and it is a well known fact that these nesting places and nests are used by the herons year after year. The nests were placed in the highest forks of the tallest trees.

nesting piaces and nests are used by the herons year atter year. The nests were placed in the highest forks of the tallest trees.

These cormorants are known by the "boys" on the fillinois River as "nigger geese," and are quite plenty, and I had for years tried to capture one to determine their species; so I picked out the largest pair I could see—they were all standing or sitting, for they always stand up sitting down, bolt upright in their nests—and let go at them with a very good shooting No. 12 gum—a first-class glass ball gun, and loaded for balls with 4 drachms and 1½ oz. No. 8 shot—the young cormorants merely shook their heads, snapped their bills and chattered a little at this salutation. I gave them the other barrel with the same result, then both again—they appeared to enjoy the fun. I then got a little mad, took another position and gave them my best choke, and pulled the trigger very hard. I guess the one nearest to me "stubbed his too." and fell down, but he "got right up," and sat down on his tail again. Well, I thought there must be something the matter with my gun, so I tried it on the young blue herons, which I think thought the Fourth of July had come, as they had nearly all left their nests and walked out on the dry limbs to see the fun. I let loose on the higgest one I could see, and down he came, and so did three more. By this time the old herons began to think there was trouble in camp, and came squawking in from every direction. I saluted the first one that came near, and killed him so hard that he fell down like an empty sack, and also three more twenty to thirty feet above the trees. I then concluded I would make the two young cormorants lay down or empty all my shells at them, so I climbed up on an enormous log, drew a bead on their heads, and let go, when one laid calmly down on his back in the nest and the other pitched forward and came to the ground, and the long wished for "Nigger goose" was mine. I think he had as many as one hundred and fifty No. 8 shot in his corpus. I found his year. The nests were placed in the boys on the flli-tallest trees. These cormorants are known by the boys on the flli-These cormorants are known by the boys on the flli-

four, two in front, two behind," and "Toes four, three in front, one behind," Now my bird has four toes, all in in front, one behind." Now my bird has four toes, all in front, so far as I can see, and what makes it worse, the four toes are firmly connected by three full webs. Have I struck a snaw?

front, so far as I can see, and what makes it worse, the four toes are firmly connected by three full webs. Have I struck a snag?

If there was a class of birds with one toe in front, two at the side and one behind, I could get along, but there was no such group. Well, there were four toes, and one of them might be called a hind toe if it did not point to the front when the bird "stood up;" so I turn to Group 4, and then to Sub-group A (the hind toe clevated), Trouble again, for I have found a hind toe. I cannot see that it is elevated, but I follow down to Sub-sub-group I, "Feet totipalmate (all four thes webbed, hind toe semi-lateral and barely elevated (A)." So I follow down until I find A, and further down I find all the characters of my bird in the genus Graculus, to which I furn, but as my bird is young and not quite full fledged or colored, I am not able to certainly determine which species of Graculus or cormorant it is; so, the "Nigger Goose" question nust remain unsettled for the present, so far as I am concerned. But I write this to give my testimony on two facts in Natural History, to wit, that these two herons in this region I have always found breeding together in the same grove, and generally with more than one nest of each on the same tree; that their nests, so far as can be observed from the ground, are exalty alke, and that a cormorant was using and rearing its young in exactly the same nests, and that all three birds had young in tar as can be observed from the ground, are exactly aire, and that a cormorant was using and rearning its young in exactly the same nests, and that all three birds had young of about the same maturity—almost full fiedged, just leaving their nests on the 21st day of August, this year of 1880. I am of the opinion that they are about three weeks late this year. Who can give facts? And, also, how long is it from egg-laying until the birds leave the nests?

neste?

As a student, I thought it very strange that a bird with feet like this cormorant, with four toes completely webbed together, should habitually perch and roost on tree; so I could not believe that my young bird was a "Nigger Goose" until I got the opinion of some of our old river gunners. I saw the old ones at the nests; they looked exactly the same as "N. Geese," and all said the young was a "Nigger Goose," This bird must, when it perches on a tree, clasp its toes around the twig just as a man without thumbs would grasp.

Lacon, Ill., Ang. 24th.

#### OWLS.

A BOUT the middle of last June I found a young screech owl in a box which I had placed high up on one of the posts of the verandah at the back part of the house, intending it as a home for some wrens, but they would not occupy it. The old owl had sat day after day on the brackets of the adjoining posts. This led me to get the step-ladder and look into the box. No nest was there. The bottom of the box was nearly covered with the elytra and wings of insects, mingled with the wings and feathers of small birds.

The young owl was nearly full grown, but still covered with time of the step with the control of the step with the result of the step with the result of the young owl was nearly full grown, but still covered with cinerous or ashy colored down with whiter bands across its head. Its horns were prominent and composed of small feathers. When the young owl first saw me he retreated backwards to the far corner of the box, and fronting me gave vent to a hissing noise, opened and shut his jaws, looking as fierce as possible—a real comical chap. As I was about to take him in my hand he threw himself on his back and presented his claws and open mouth. I brought him down and placed him on the floor, where he still showed a pugnacious disposition. His performances and appearance were so singular and amusing that I afterwards showed him to some visitors, when he was as brave as ever. His feathers came out rapidly, so much quicker than I expected that he flew away and escaped a prison cage, I intended also to shoot one of the did birds for close inspection. I saw or heard nothing of them for several weeks, but recently I have head them or others like them at night.

I am not sure that these are true screech owls (Scops assio). They may be Western mottled owls (Scops narrallu). They certainly make a noise at night very much like screech owls, and also resemble them in plumage.

Do the old owls carry their young from place to place for safety? No nest was in the box and but one young one. I think the other young birds were

old dies would nave been apt to have oven seen there abouts when eggs were being laid and set upon, but they were only seen a short time before 1 sux they oung one. In the winter of 1876 a snowy only (Nyetea nivea) was shot near Austin and brought to me for name.

Austin, Faxus, Aug. 17th.

S. B. BUCKLEY.

Cool.—About a week since, while examining the web of a well-fed house spider of ordinary size which had stretched his net across the corner from the body of the house to the extension, and had supplied his larder with a goodly stock of mosquitos, moths, etc., I observed at the same time a bluish looking wasp come bobbing along the side wall, when all at once bang he went into the spider's web. I thought he was caught, sure. Every half second he would kick and shake as though indeed he was slow in responding, but after a number of shakes he darted out and attempted to secure the wasp, but no sooner had he cast a strand of his web around the foot of the wasp than the latter gave the web a jerk, bringing the spider within his grasp. Before the spider could recover himself enough to think of running he was inclosed in the deadly embrace of the wasp, and in lees than a second the latter had doubled up and had pierced the poor spider with his deadly sting a dozen times. One would suppose the web would offer some obstacle to the wasp, but not a bit; he was as much at home in the web as the spider. He took the dead spider in his mouth, deliberately crept through the web, went down on the inside, out under the bottom and bore off his victim, I suppose, to fatten the young progeny of the captor. pose, to fatten the young progeny of the captor.

STRAIGHT BORD.

In this connection we would refer our readers to an article entitled "The Solitary Wasps," printed on page 378 of volume XI. of this journal.

ARRIVALS AT THE ZOGLOGICLL GARDEN, CINCENARI, IP TO SEPT. IST.—One clk (C. conadensis), one llama (Lama perudua), one zobu (Bas indicus), one yak (Bāson prunniens); all born le garden. One passenger piecon (E. migratorius); batched in garden. Two egrets (Herodise quetta), one military macaw (Ara military), one baid eagle (H. leucecphalus); all presented. Three green monkeys (Creptificeus callitricius), one vervet monkey (G. falandil), two common macaque monkeys (M. epumonolyus), one brown tengueitin (Cobus fatuellus), one black handed spider monkey (Ateles metamochir), one Indian elephant (E. indicus), one brown thrush (Harporphichus ruique), three Battimore orioles (Icterus baltimore), seven orebard orioles (L. spurius), one cowbird (Morbatrus genoris), six bobblisk (Dolichonge originalus), four pinis broasted grosseals (Gardivac budoeletann), six in-ARRIVALS AT THE ZOULOGICAL GARDEN, CINCINNATI, UP TO rorus, three yellow headed blackbirds (Xanthoerpalus lettrocephalus), four pinis breasted grosseals (Giuraca bidoctana), six indigo birds (Cyanospita cyancat. 7 nonparells (C. citis), three Virginia cardinals (C. virginianus), one red-headed woodpecker (Melainerps crythrocepalus), four cut-throat finches (Amailina fasciata), six Java sparrows (Faidia orgivera), four zebra wax-bills (Estrebia audiaca), civir amailyade finches (Estrebia audiada), four red-faced weavers (Toutia crythrops), four orange weavers (Eupleches franciscanus); sill purchased.

SOLES AGAIN BROUGHT TO AMERICA.

CAPTAIN J. H. MORTIMER, of the ship Hamilton Fish, a gentleman well known to the naturalists of Europe and America by his valuable contributions to science in many of its departments, has succeeded in bringing over some live soles and depositing them in our Our readers may remember that the attempt was made in the winter of 1877-'8, and only two specimens survived the change of air from the gulf stream to the "banks," and were deposited in Massachusetts Bay. (See Rep. U. S. Fish Commission, 1877, p. 867.)

In both these cases valuable assistance was rendered by Mr. Moore, of the Liverpool Museum, and Mr. C. L. Jackson, naturalist of the Southport Aquarium, in procuring the fish. The following is the report made by Captain Mortimer to Prof. Baird of his methods and the incidents of the transportation of this most valuable little fish, which is deservedly a favorite in Europe :-

When at Liverpool last March it occurred to me that my return passage to the United States would afford a favorable opportunity for the transportation of live soles across the Atlantic at that early period of the present year. The existence of ice abounding on the ordinary year. The existence of ice abounding on the ordinar track would induce me to take a more southerly course

year. The existence of ice abounding on the ordinary track would induce me to take a more southerly course, which, in connection with the more equable temperature of a middle passage, would afford a better prospect of success in my undertaking.

Communicating my intention to Mr. T. J. Moore, curator of the Derby Museum, who for years has been ever ready to assist in my attempts to transport fish, mollasist, amemones, etc., and which have been ordinarily successful, very much owing to his kindness in furnishing me material and data (all important), referring to the habits and habitat of intended companions for the voyage. Considering the habits of various fish, especially the sole, in this case I suggested to Mr. Moore that very young sole should be procursed from the Mersey River lishernen and placed in the tanks of the aquarium for the purpose of acclimating them, as it were, to the confinement to my small globes or tanks on shipboard. While the ship remained at Liverpoot this was accomplished, and on the eve of my departure for New York the number of sole obtained was only nine, the largest not being more than five inches in longth. The season not being favorable for obtaining the smaller this (which I much preferred, on account of the lesser amount of aeration required for their well doing). I was supplied with fine gravel, coarse river sand, earth worms in sod, mussels and cockles, which I had hoped to have preserved alive for fish food.

My method of transporting these soles was in ordinary

neration required for their well doing, I was supplied with fine gravel, conres river sand, earth worms in sod, mussels and cockles, which I had hoped to have preserved alive for fish food.

My method of transporting these soles was in ordinary glass globes of about four galons capacity, which, resting on a disk of wood equal to their diameters, were suspended by six cords to hooks in the carlines of my cabin where they would swing freely and in accordance to the ship's motion, and with but very little disturbance to the water contained in them. Gravel to the depth of two inches was placed in the bottom of the globes, which were there parts filled with water from the aquarium, and three sole were placed in each tank, which were then suspended where they would swing clear of each other. During the first three days of our passage, and through the Irish Channel, my ship duties prevented her from giving much attention to the fish, other than that the water was well acrated. This was effected by the use of a large syringe, the use of which was subsequently abandoned in favor of a small dipping-net of coarse crash, about four inches in diameter. This would effectively aerate the water by briskly disturbing the surface, which could be accomplished in a few minutes and without disturbing the lower part of the water or the sediment.

On the fourth day out—being then at sea with an offing—I observed a turbid, milky appearance in a globe containing three of the largest fish, one of which was dead. Without loss of time I prepared a fourth globe, which I tilled with ocean water brought to a density comparative with the original Mersey water by an improvised hydrometer and admixture of fresh water from the ship's tanks, and which was allowed to remain six hours until it had acquired a temperature equal to the water in the other globes; meanwhile, the sish had been removed from the inspure water, and were subsequently removed to the fourth globe and new water. This accomplished, I attempted to feed them for the first time by

tage of thaty-one cays.
The following morning the fish which had enjoyed a

change of water were both dead, and were afterward preserved in methylated spirits. Presuming from this fatality that the reduced seawater was not congenial to sustaining the sole, I had recourse to the original sup-ply of Mersey River water, which, every three days, sustaining the sue, I had recourse to the original sup-ply of Mersey River water, which, every three days, when slightly contaminated by the fish, was decanted by a siphon from one globe to another, allowing the stream from the siphon to fall some four feet through by a siphon from one globe to another, allowing the stream from the siphon to fall some four feet through the air, carefully avoiding the sediment. This method by decanting three times, would thoroughly re-aerate and sweeten the water, and this process was maintained for the remainder of the time the fish were on shipboard, making up the loss by wastage and evaporation by adding sea and fresh waters of as near a density as could be determined. It was observed that the sole were inclined to hurrow. The gravel being rather dense for that accomplishment, I added sand that had been well washed until it would settle in a short time without clouding the water. The sole took immediate advantage of this addition, and would remain under the sand, excepting a small portion of the head, and were only distinguished by their brilliant eyes peering out of their comfortable bed, except when disturbed by the acrating process, or absence of air, when they would come to the surface and, by their splashing, alvise their keeper that it was time to use his surface net or disturber. For the first few days the fish were easily alarmed by the approach of any strange object, but afterward seemed reconciled to their new habitat, and, like Dr. Tanner, lived upon air and water; for, during the whole voyage, they declined the food offered to them. Upon arriving at New York harbor I took on shore, in twe globes, five of the pine soles which I had emplayed all seguingly in they occlined the food offered to them. Upon arriving at New York harbor I took on shore, in two globes, five of the nine soles which I had embarked, all seemingly in good condition after their long fast and the changes of temperature they had been subjected to, and which, at one time, while passing the flow of the Arctic current, in longitude 48° west, the water temperature was as low as one time, while passing the now of the Arctic current, in longitude 48° west, the water temperature was as low as 34° Fahrenheit, while the mean temperature for the passage was about 56°. Mr. E. G. Blackford, at New York, took charge of the sole, which, within twenty-four hours were planted in New York bay, just outside of Sandy Hook, care having been taken that the temperature of the water than york on the conditions of the water than york by was gradually beought to an condition

were planted in New York bay, just outsider fours were planted in New York bay, just outside of Sandy Hook, care having been taken that the temperature of the water they were in was gradually brought to an equality with that of the bay water, which was much colder. At this writing, the time of my departure is near for a voyage to the North Sea, which will prevent a repetition of my experiment, at least with the sole. But from the recent experience with them I feel satisfied that their introduction is practicable. I would suggest that they could be brought by steamers in the swinging globes, and during a passage of twelve days would need no change of water, nor food. The only labor connected with their transportation would be a simple aeration of the water, say every eight hours, and protection from the very severe and sudden changes of temperature which must occur about midway the transatlantic passage. There might also be taken into consideration the propriety, perhaps necessity, of a preserved habitat, which might be arranged for their reception, the sole being doubtless quite able to take care of himself, through his acquaintanoe with the habits and offensive means of his British nemies. Knowing of their extensive colonies in native waters, we may assume that they are well up in the philosophy of the survival of their extensive colonies in native waters, we may assume that they are well up in the philosophy of the survival of their fittest. But do they know our blueish, that will swallow any moving object within the capacity of their swallowing? Does he know of the facility with which the sheepshead may crush a clam, or of the affectionate embrace of the startish? If not, he must be protected until a knowledge of the defensive means to be used are acquired by the sole. Then they will adapt themselves to the most favorable surroundings within their reach, 'colonize and increase,' and following such a happy result, our ichthyophagists may enjoy a fillet of sole that may not have been sliced from a fishy flound

#### CODFISH HATCHING HAS BEEN SUCCESSFUL.

GLOUCESTER, Mass., Aug. 24th.

Editor Forest and Stream :

GLOUCESTER, Mass., Ang. 24th.
Editor Forest and Stream:—
Inquiries among the boat-fishermen, who fish off this harbor, have brought to light some interesting facts connected with the batching of cod (Gadus morrhua) at this place winter before last by the United States Fish Commission. It appears that last summer, a few months after the young fish had been "setadrift" off the barbor's mouth, to seek for themselves, many were found in the harbor from an inch and a half to two inches long, presumably some of those that were hatched at the station.

This summer none have been seen in the harbor, but the fishermen report having frequently caught, just outside the harbor, a mile or so from the entrance, small cod measuring from live to seven inches in length. Sometimes as many as six or seven have been taken at one time by a single person, and this is all the more remarkable as the fishermen say they have never known the like to occur before. Unfortunately no specimens have been obtained, as the fishermen have thrown them away, they having no market value. Although there can be no absolute certainty that these are the fish that were hatched by the Commission, there not yet being any authentic account of any being caught labelled U. S. F. C., still, taking into consideration their size, and the fact that codish of such a size have never been found plenty before, it seemed no more than reasonable to suppose that these are some of the lot sent out by Uncle Sam, and that the little fellows are still langing around home. J. W. C.

#### CALIFORNIA SALMON EGGS.

The following circular has been issued to the different State Fish Commissions :-

UNITED STATES FISH COMMISSION,

ONITED STATES FISH COMMISSION,
FISH AND FISHERIES,
WASHINGTON, Sept. 1st., 1880.
As the California salmon eggs collected by Mr. Livingston Stone at McCloud River, Cal., during the present season will before long be ready for distribution, I write to ask you what number you are desirous of receiving in behalf of your State, to be hatched out and planted in public waters

public waters
It should be understood that the freight from the hatching station is to be paid by yourself, and possibly an additional charge not to exceed \$1 per thousand for the expense of packing and shipping.

Please advise me of the address to which the eggs are to be shipped. Due notice will be given you by telegraph, or otherwise, of the time when the eggs may be expected. They will be ready to forward about, or not long after Oct. 1st.

SPENCER F. BAIRD, Commissioner.

LAKE TROUT EGGS TO BE HAD IN QUANTITY.—The following letter is self-explanatory : WOLFE ISLAND, Aug. 28th.

Prof. S. F. Baird :-

Prof. S. F. Baird:—
Sit:—I beg to inform you that the fishing grounds in Lake Ontario, situated about ten miles from Cape Vincent, where the New York Fish Commission have obtained all their salmon-trout eggs, is still in operation. The proprietor has been notified that the New York Commission will not require any this sesson, and so far no other person has made arrangements for the spawn. If you know of any fish breeding establishment which is desirous of obtaining two or three million of salmon-trout eggs please advise them to apply at once to Patrick Troy, Wolfe Island, Ontario. The salmon-trout fishing commences immediately, and ends on the 30th of October. Communications will receive strict attention.

Very truly yours.

Peter Riel, Fishery Overseer.
We understand that eggs will be furnished already im-

We understand that eggs will be furnished already impregnated if desired.

#### TROUT MURDER.

THE mill pond at the head of Caledonia Creek, including the springs, was suddenly emptied on the last day of August and the whole stream poisoned by the disturbance of the sediment and the consequent liberation of sulphuretted hydrogen. Mr. James Annin. Jr., whose ponds are the first below the spring, is the main sufferer, as he owns the stream for some distance, and depends largely upon it for his supply of eggs to meet the demands of his customers, and not so much upon the fish in his roads.

as he owns the stream for some distance, and depends largely upon it for his supply of eggs to meet the demands of his customers, and not so much upon the fish in his ponds, which are fed by other springs. The State hatchery also suffers in the loss of salmon, native and Western trout, which were beyond price as breeding fish.

It is claimed that this lowering of the water in the mill pond is necessary for the purpose of removing the weeds which fill it, but the owners know by experience in former years the terrible consequences attending its sudden lowering, and should be held responsible by law for all damage done to those below them. It will take at least three years to replace the trout killed, but the market value of the trout lost does not represent one-tenth of the injury to either the State or Mr. Annin, to both of whom each fish represented a definite number of eggs, which are not only lost this year but for succeding ones also. If there is no law which covers this case, and protects fish culturists from the acts, careless or otherwise, of people who may have property above them, then we suggest that one be framed and passed at the edrliest opportunity. opportunity

#### ALASKAN ICHTHYOLOGY.

PRING is gone, but not with it the great deposit of snow, which still covers the mountains to such extent that prospecting and quartz mining are still impracticable. We have passed through the most severe winter recorded in the annals of Alaska, but the spring has been almost continually pleasant. I doubt if there is a spot in the temperate zone where the "precipitation" has been less than that at Sitka, whose climate has been so nuch belied. During March, April and May there has been rain or snow on 468 hours, or on less than 21 per cent, of the time, and there has been blue sky and sunshiny weather on 1,309 hours, or nearly 60 per cent, and during the intermediate 19 per cent, of the time there has been blue sky and sunshiny weather on 1,309 hours, or nearly 60 per cent, and during the intermediate 19 per cent, of the time there has not been altogether as much fog as I have seen on our eastern coast in half a day. By months: March, 31 days, 744 hours, snow 148 hours, blue sky 438 hours; April, 30 days, 720 hours, rain 117 hours, snow 8 hours, blue sky 401 hours; Ilay, 81 days, 744 hours, rain 148 hours, snow 0 hours, blue sky 470 hours. Can such a climate be justly termed "sunless" and made up of "gloom and fogs."

Had we had more rain we would have been better off in many ways; the snow would have been better off in many ways; the snow would have been troubled with a scarcity of water. It may turn out that this temperary stoppage of mining developments in this vicinity with prove a blessing in disgin. A large number of min rs who have been a wintering here have lost their lopefulnes, as their "stakes" dimmished and have te-ken advantage of the invitation brought by the Indians, who

last fall went from here to the Chileat country upon the occasion of the shooting in a drunken row of the Chileat Chilef, Klotz Klotz. And on the 20th an expedition, consisting of five boats, viz., the Chileat Chief, Capt. Edmund Bean; the May Flower, Capt. Robt. Duggan, ite Industry, Capt. Win. Zoble: the Sitka Jack, Capt. McCluskie, and the launch of this ship, the whole party under the command of Lieut. E. P. McClellan, a volunteer for the duty, started for the Chileat country, and five days after were spoken within forty miles of their destination. With them went, as interpreter, "Dick," a nephew of the Chief, a man who is, for an Indian, reliable, and who brought down from his uncle the invitation to the miners to come. Dick's influence will be useful, inasmuch as he is the presumptive heir to the chieftainship through his blood, and he has further strengthened his chaim by marrying, on his last visit, his aunt.

If this expedition proves a success, and the Chileats yield to the advance of the whites, a terra incognito will be thrown open, and if, as is reported, there exists in that country valuable "placer" prospects, the results will be of great importance to Alaska. I am not very sanguine: selt-interest teaches the Chileats to retain in their own lands the trade with the interior tribes, and it will be only by showing them plainly that the coming of the whites will be to their advantage that their consent can be obtained. None veryons.

Mr. Marcus Baker, of the Coast Survey, who arrived liter by last steamer, and who, until the departure of the expedition, was engaged in magnetic work, accommanded the expedition. The last two weeks have been very lively in Sitka: hardly lad the sensation produced by the starting of the expedition died down than the town became again excited by the arrival of the schooner R. L. Handy, 19 days from San Francisco, with goods for a storekeeper, who, having seen the crivors of his ways, has repented and promises to sell to us goods and groceries at something less than the e

My Bathymaster signatus, it seems, is my most valuable addition to the national collection; but two specimens of this have hitherto been obtained, one of which is in the possession of Prof. Cope, who originally described it in 1873, and the other is owned by the Alaska Commercial Company; both were obtained in Alaska. Bean's description of the fish is as follows:—
"It resembles the rock cod, except that the dorsal fin is continuous and extends along the whole length of back. On the head there are numerous prominent nucous pores. Our specimen is ten inches long and was caught over the ship's stern in March."

Examining my collection by the aid of the light of science I find myself compelled to own up that I didit, I'll correct a few of the mistakes which have occurred in my letters: First, as you will see by my list, I have not correct a few of the mistakes which have occurred in my letters: First, as you will see by my list, I have not caught any fontinatic, which is rather mortifying, as I thought that my Adirondack experience had qualified me to be an authority on the subject, I knew they had square tails and crimison spots and various other peculiarties, but I didn't know that they were destinute of "hyoid" teeth, nor that the trout described by me as a fontinatis, but rather light for its length, and tail not quite so square as that of our eastern trout, fontinatis, was the owner of a set of the same sufficiently developed as to show him to be a Salmo spectabilis, of whom I never before had heard.

to be a Salmo spectabuts, of whom I never before had heard.

Next, the large trout described in my letter of May 11th as coming from a lake near Mount Edgecomb, and to me unknown, I find to be precisely identical with a trout described in my letter of Sept. 8th as a mountain trout, and that the species is Salmo irideus, that is, as far as can be judged from my collection of its characteristics. In everything but size Bean assures me that I describe an irideus, and my ten-inch bottle specimen confirms him, but thirty to thirty-six inches is a development beyond his expectations. The Edgecomb fish (we had both sexes) were outfilled with ripe ova and milt, and no other trout or salmon procured thus far this spring is so far advanced.

I would like, through your paper, to inform Hi. Nichols and Hank Ruder that if this summer they catch in the original Pisece Lake or its tributaries a trout with hyoid teeth they had better send it, in whiskey, to the Smithsonium.

We have not yet got hold of any of the salmon trout, they not having run into the streams. Several have been taken by the Indians in their nets in salt water,

but they were eaten and none have been caught since Bean's arrival.

Bean's arrival.

About the 20th of May a very beautiful trout was taken in large numbers from a little lake just back of the town, which on our chart is christened "Piseco Lake."

The habits of this trout are peculiar. Every spring, for about ten days, they are plentiful close to the shore, among the lily pads, and will bite on anything except a fly. Before and after this short season none are obtained.

ny, before and after this short season hone are obtained.

My description of this trout is as follows: Specimen caught May 27th; length, 9½ inches; depth, 3½ inches; weight, 5 ounces; colors: back, dark brown, growing lighter toward median line, at which there is a longitudinal purple stripe extending from opercle nearly to tail, below the median line nolive green, lightening to silver white on belly. The entire tinted portion of the fish has a beautiful golden irridescence, so much so that when looked on from the rear, being held in sunlight, the fish seems to be gilded. Excepting the belly, the surface is profusely sprinkled with oval black spots, which mark also the dorsal, adipose and caudal fins; the pectoral, ventral and anal fins are yellowish-tipp: d with crimson. Tail nearly square, but not as square as that of the fon tinatis.

tinalis.

It has hyoid teeth, and we make it out to be the salmo-clarkii, a non-migratory trout from the fresh waters of British Columbia, Oregon and Washington Territory, None of those taken contained eggs, while the supposed irideus from Edgecomb Lake contained both eggs and

irideus from Edgecomb Lake contained both eggs and milt, ripe.

Bean, who is indefatigable, has obtained several fish which I had not hitherto known existed here, among which is a genuine codifish and some skates, all of which he has duly numbered and described.

The steamer Favorite brought over from the Hootze-noo banks, near Admiralty Island, quite a quantity of genuine cod, both fresh and salted, which we find to be quite as good as are the cod on our Atlantic banks.

Bean brought me the FOREST AND STREAM of April 22d and 29th, in which appear the letters from Henry Elliott and myself.

After this letter of E.'s, I conclude that my best plan is to give up, not my views, but the attempt to make with them any impression upon his preconceived opinions.

ns. I will, however, in terminating my share of the dis I will, however, in terminating my share of the discussion, simply protest against his endeavor to array Capt, Bailey—who is dead—against me, by quoting his honest and I have no doubt correct views as to "Alaska north and west of Sitka "as disproving my assertions in regard to Sitka and vicinity, and also to state, without any reservation, that Elliott's statement that "one successful planting in four years is the rule at Sitka," is not true. Year after year good crops are raised from seed furnished by their predecessors, and an "unsuccessful planting" is a rare exception.

nished by their predecessors, and an "unsuccessful planting" is a rare exception.

And finally, I must protest against his statement that "Piseco agrees with him in the main." I decline to be placed on record as indorsing his views, which I most distinctly do not. "The war of potatoes is ended."

Strolling, to-day, along the beach, I saw, moored near a saw-mill which has been patched up and set to work, two immense spruce logs—one was \$4 feet and the other 79 feet long, and very clear from knots. The lumbermen told me that they contained, one a little over and the other a little under 4,000 feet of lumber, and that such logs were plentiful within four or five miles, near the water, and that, delivered at the mill, the two cost him \$40.

Some of the miners who have been hybernating here this winter have employed their time in cutting lumber, and there is on the beach a pile of spruce planks, gotten out by hand, with whip-aws and axes, many of which are from 40 to 96 feet long, 4 inches thick, and with very few knots.

June 9th.—The steamer is in, and I, of course, busy enough to justify my cutting short this letter. Unexpectedly to us she was "on time," an unusual event.

The launch sent with the expedition to Chilcat returned on the 5th inst., having perfectly accomplished its mission.

The gate has been opened, and a crowd of American The gate has been opened, and a crowd of American miners are now prospecting this unknown land with the full consent of the Indians, who have furnished to them all required facilities, and the tribes who have been making war at Wrangel have promised to ceaso hostilities.

Dr. Dall arrived on the steamer, and soon after her departure, he, in the Yukon, will proceed on his voyage to the Northwest.

The steamer brought me a jar of "oulachons" and some notes regarding them, which I will work up in my

ext.

Dush va dania—which is Russian for au revoir.

PISECO.

BLACK BASS IN THE DELAWABE.—This fish was unknown in the Delaware previous to 1875, when several thousand were placed in the river at different places be tween the Delaware Water Gap and Trenton by the Fish Commissioners of New Jersey and Pennsylvania. They grew very rapidly in their new home, as they have done in every other instance upon record, and two years later "myriads" of young fish could be seen all along the river between the points named, The season for catching them opens June 1st, and closes in December, and all bass under six incluses in length are prohibited by law from being between the points named. The season for catching them opens June 1st, and closes in December, and all bass under six inches in length are prohibited by law from being taken at any time under a penalty of ten dollars for each fish. This law is constantly violated both in respect to the size of the fish and the season for catching. They are said to be "off their feed" in June, for the reason that during that month they do not bite freely, but from the middle of July to the 1st of September they take the bait freely, and often do so far into October, although the close of September brings the close of good angling for black bass on this river. Probably the best fishing grounds are at Lackawaxen, Shohola, Pond Eddy, Port Jervis, Milford, Dingman's Ferry, Bushkill and the Water Gap. The first named place is the extreme point which they can reach going up on account of the dam of the Delaware and Hudson Canal Co., which was built and is used as a feeder to the canal. Here the fish seem to be larger than below, and a fishway should be provided for their ascent, as they seem to be crowding here to get up further. Few small once are taken here, and in fact not so many in number as at other points lower down, but they are of a larger size, THE MAINE PONDS.

Hyde Park, Mass., Sent. 2d.

HYDE PARK, Mass., Sept. 2d.

WAlthough it seems almost useless to attempt to write about the Maine woods, after reading the many and glowing accounts of the hunting and fishing in Maine which have appeared in your valuable paper since its first publication, yet I wish to make known to the readers of Forest and Stream a part of Maine known to but few, because heretofore difficult of access. This is the region about Eastis, a town about fifty miles north of Farmington. Within about twelve or fifteen miles of Eustis hills are situated many ponds, of which Tim Pond, advertised in your columns, is one, and the only one which has had any good accomodations for sportsmen, except Alder Stream Pond. The nearest pond to the mills is Jim Pond, distance about three and one-half miles, which is reached by boat on the North Branch of Dead River, two miles, and a carry of a mile and a half over a good lumber road. At this pond Mr. O. A. Hutchins, of Eustis, under whose guidance I, with a genial companion, spent two happy weeks this summer, has just completed a fine new log camp eighteen fect square, for the ponelis of sportsmen, fitting it up with a stove and many they coversioned. pieted a fine new log camp eighteen teet square, for the benefit of sportsmen, fitting it up with a stove and many other conveniences. This pond abounds in lake trout, Salmo namayeush, speckled trout, Salmo fontinalis, and a fish which I took to be land-locked herring, but am

a fish which I took to be land-locked herring, but an not sure.

By taking a team to haul the baggage to Ledge Falls, three miles, where one will find another camp just built, he can reach the chain of ponds, distance twelve miles by North Branch, which can be reached by boat with a few short carries. Here one can find a good camp, good fishing for lake or speckled trout, while there is no better spot for deer, moose or carribon, and from lere several other ponds can be reached, which literally swarm with trout, while the seenery of the whole region is wild and beautiful, always changing as one moves from point to point.

other ponds can be reached, which interaily swarin with trout, while the scenery of the whole region is wild and beautiful, always changing as one moves from point to point.

If one does not wish to go to the chain of ponds, he can go up three miles from Hedge Falls to Alder Stream. famous for its trout, up Alder Stream one and one-fourth miles, then a carry of five miles, and he will come to Alder Stream Pond, a sportsman's paradise. Here one will find a new and well equipped canny, built under the directions of Mr. Hutchins. A pond so clear that one can see trout fifteen or twenty feet below the surface, and full of the handsomest silvery-sided speckled beauties 1 ever saw, and enough to last for years if only true sportsmen go there. The scenery is delightful, and the woods full of deer, cariboo and ruffed grouse.

Mr. Hutchins, with his usual enterprise is having a road cut through to Spectale Pond, Kibby and Spenser Streams, King and Bartlett Ponds, and Spenser Pond, on all of sportsmen. Such forethought for the comfort of sportsmen ought to be rewarded, and I hope that Mr. Hutchins and the other guides of Eustis who are assisting him in this good work will receive the patronage they deserve. This new road to the ponds just mentioned will be completed by the 12th of September, just the time for good fishing and hunting, and letters addressed to Mr. O. A. Hutchins, Eustis, Franklin County, Maine, will receive prompt attention, and the writer will receive in receive prompt attention, and the writer will receive in cents for a dinner or a night's lodging. Guides with boat can be had for from \$1.50 to \$2 per day, according to place visited.

The expense at Eustis will be found very light. I was charged twenty cents a day for keeping a horse, and eighteen cents for a dinner or a night's lodging. Guides with boat can be had for from \$1.50 to \$2 per day, according to place visited.

The lare from Boston to Farmington and return, \$9.50, from Farmington to Kingfield by stage, twenty miles, \$1.50, from Farmington to

The fare from Boston to Farmington and return, \$3.50, from Farmington to Kingfield by stage, twenty miles, \$1.50, from Kingfield to Eustis, twenty-eight miles, \$1.50, I think. So that the fare from Boston to Eustis and return will be about \$16. This is the time of year when they catch the most and largest trout, during September and October.

E. D.

and October.

Tim Pond.—Eustis, Maine, Aug. 24th.—I am here again, just arrived. This is my third annual visit. Mr. Smith has made great improvements since first I came here, in boats, cabins, road, horses, etc. When I cached here all the camps were full (except the new one just being finished) with those here for the second time. They tell me trouting and hunting were never better here or elsewhere than now. After a few hours with the rod and gun I find they are quite right. Am told large game is plenty, and the right sportsman are now coming here to take such. It is now easy to reach here from New York or Boston. Come to Farmington by rail, then Dan Clark's stage will take passengers direct to Kenny Smith's Farm House. From his house he runs buckboards seven miles to the cabins. Parties can always be accommodated by engaging "apartments" in advance.

J. Warren Tuck.

The Hole is Left Yer.—Rangeley Lakes, Camp Kenebago, Aug. 33d.—Below you will find a schedule of the size and number of trout taken in the Mooselucmerunic Lake, Aug. 20th, by Mr. Kodgers, of Mansfield, Mass., and his guide, Rufus Crosby, of Rangeley, Maine. This may sound a little fishy to some of your readers, and I may as well state that I did not see them myself, but opied the list from one who did, and I have good authority for giving this as correct. They were taken in from thirty to forty feet of water. Time, from 1 P.M. until 3: One of 84 pounds, one of 4 pounds, one of 5 pounds, three of 8 pounds, one of 4 pounds, one of 1 pounds; six of 1 pound; total, 52 pounds.

MINNESOTA FISHING .- A correspondent who has been fishing some of the Minnesota lakes, kindly sends us the following notes :

following notes:—
On coming to Minnesota I went to Waterville, where there is said to be the best flishing in the State. Lake Tetonka is the best place, and abounds with pike, black bass and croppie. Roke bass are also very abundant. I eaught a fine string of them, large ones, that would average nearly a pound, but on opening them I found that their flesh was filled with parasites. These seemed to be black cysts, covered with short hairs or fuzz. They were about the size of fleas, and cracked like a flea when pressed with the thumb naul. I presume these are cysts that inclose the animal, whatever it is. Black bass at

first refused to bite, but yielded at last to the seduction of grasshoppers. I caught many croppie, all very large and fine, weighing about two pounds. In another lake near by I found the common sunfish, or sun perch, in wonderful abundance. I caught several that would weigh over a pound, the largest was 1½ pounds. By natural fly-fishing any number can be taken. They rise readily to the artificial fly, but always contrive to nip so gingerly as not to get harmed, whereas they swallow the natural fly. This manner of biting appears to be common to the whole perch family, and even bass must be allowed to swallow the bait before being struck.

common to the whole perch family, and even bass must be allowed to swallow the bait before being struck.

Maxistucker, — Indianapolis, Ind. — This lake is in the southwest portion of Marshall County, Ind., twelve miles from Plymouth and nine miles from Argus, It can be easily reached from either station by hack lines running backward and forward. Maxintuckee is derived from an Indian chief who was drowned tong before either you or I can remember, but the old settlers around there have often related to me the circumstances as told by their grandfathers. The chief's name was Maxintuckee, and he lived with his squaws on the banks of the lake. He met a beautiful princess, who came with her father to fish in the lake, as was his wonted custom every summer; and he wooed and won not, which farew him into a fit of despondency, and now his remains lie at the bottom of the lake, where the lish swim into his hollow body and the turtle crawls around in his skill; but little do we, the merry, jolly lot of boys and girls, think of this poor Indian whose name we hear mentioned avery day. The lake is surrounded by hills covered with woods, which offer some beautiful spots for club-houses. The bottom is clear to a wonderful depth, and everywhere around the lake is a smooth, sandy slope from the shores to the center. Not a place around the whole lake can there be found a "step-off," which makes it an unusually fine bathing place. The varieties of fish caught there are bass, perch, goggle-eyes, etc., but those who go there do not fish much, for the fishing is rather poor, it having been fished so much in the last year or two. In the duck season there is good sport, and the reedy marsh banks of Lost Lake, the outlet of Maxintucke, offer splendid protection for the hunter. There are eight club houses here and it is fast growing to be a summer resort instead of the wild, desolate spot where the sportive bass and the minule squirrel made their home a few years ago, and we fellows, who wish for solitude, where we can lish, hunt and ca

A Bro Trout,—Cleveland, Ohio, Ang., 28th.—Linclose the following clipping from the Leader: "In your issue of yesterday, you spoke of two trout just received from the Sault, measuring seventeen and eighteen and a half ininches respectively, and saying that your columns are open for further statements, Arthur Cogswell caught in the Nepigon River and sent home last week a speckled trout measuring twenty-two inches in length, and weighing six pounds two ounces when taken from the water. Affidavits of reliable parties as to weight and measurement can be had if necessary.

ment can be had if necessary.

\*\*A I was a member of the party to which Cogswell belonged, and weighed the trout mentioned, when taken from the water, on a pair of scales tested both before and after our trip. I am willing to take my affidavit that it was a genuine brook trout, and weighed six pounds and two ounces. We caught as near as can be estimated, two hundred trout that would weigh from three and a half to five and a half pounds, besides any quantity of smaller ones. This, however, was the largest. L. H. COWLES.

ones. This, however, was the largest. L. II. COWLES.
STRIPED BASS FISHING IS GOOD.—The fishing for
striped bass has been good at many points along the
Atlantic coast this season. Last week Mr. J. W. Little,
of Now York, caught fifteen in three days at Narraganset pier, the smallest of which weighed eight pounds,
and the largest one forty-two pounds. The latter was exhibited at Sutherland's restaurant on Liberty street, and
afterward was served up at that famous hostelry.

Pennsylvania papers chronicle rockfish (the same animal
under another name, and therefore just as sweet) as
plenty in the Delaware. Even as high as Harrisburg they
get them of half a pound weight in considerable numbers. In former years we used to take them at Albany,
with a bait of sturgeon spawn, but alas, the bass and
sturgeon have both gone.

sturgeon have both gone.

sturgeon have noth gone.

NEW Fish.—Another new fish has been found by the U.S. Fish Commision. In a recent note from Prof. Goode he says: "We have found a remarkable new fish of a new genus and probably of a new family, related to the family Ateleopodidæ, hitherto only known from Japan. It is about three feet long and looks like a young sea serpent, It came from the stomach of a ground shark, taken by the schooner The Gatherer, on the Grand Banks. We have christened it Helorus voraginorum. The description will appear in the next signature of the proceedings of the National Museum,

THE "BLUE GILL" TRIP.—Fort Wayne, Ind., Aug. 25th THE, ISLUE GILL" THIP.—Fort Wayne, Ind., Aug. 25th—Hat four of the club went. They kept no diarry, but reported bass and pickerel fishing immense. One member lost in Pickerel Lake a fine split bamboo rod and appurtenances. They further reported the lake very high, and the grayling streams too high to fish while they were there. They had a grand time. W. D. M.

SALMON CANNING .- Shipments of canned salmon from the Columbia River, Oregon, this season have been moderately active thus far. The bulk of it, 230,000 cases, has been distributed to the markets of the world from San Francisco.

#### PUBLISHERS' DEPARTMENT.

Scientific Success.—An American college of physicians once offered a reward for any authenticated case of genuine Dabetes which had been entirely cured. The offer remained open for resecutive are and was then withdrawn. Were it in force now, it could instantly be secured by the proprietors of Warner's safe to the notice of the writer. Diabetes is a most described that it is the notice of the writer. Diabetes is a most described the who are suffering from ill health, and do not know the cause, should not delay, as it may be at the cost of life, which Warner's Safe Diabetes Cure is guaranticed to save.

of affairs:—

"Within the present year the powers and duties of the Commissioners of Fisheries for Maine have been extended (as also of wardens) so as to apply to the enforcement of the game laws. Already there have been many offenders apprehended and fined for killing deer and birds during close time, and one of the more recent cases was a violation of the law on woodcock, that cost the offender \$40 and costs—a total of \$50—\$hooting woodcock before Sept. 1st. In all these cases one half the fine is paid to the prosecutor. In the instance referred to, the prosecution was made by one of the commissioners, and he received the amount to which he was entitled by law as prosecutor (\$20), but gave it to the County Treasurer for the benefit of the poor of the county in which the offense was comitted.

. The commissioners prosecute every case of violation of "The commissioners prosecute every case of violation of the fish and game laws of which they have knowledge whenever the necessary evidence can be procured. If the Legislature of each succeeding year grants the necessary appropriation for the support of this department the fish and game laws of the State will each year be as well en-

and game laws of the State will each year be as well enforced as other laws.

"Printed abstracts of the general law of the State relative to fish and game have been distributed, so that there need be no transgressions through ignorance if no change is made in the existing well known and excellent laws.

"The next annual report of the Commissioners of Fisheries and Game will probably afford some profitable reading, especially for those who have been in the habit of ignoring the laws of this State."

The following comes to us from a Portland corres-

pondent:

Seene—Thode Davis' Gun Store, Portland Correspondent:

Seene—Thode Davis' Gun Store, Portland, Maine, Time, 1 r. M., Ang. 28th.—Enter Dr. ——. Clerk—"Doctor (who had been after game with an old carbine), Everett Smith will be after you." Before a reply could be made the Doctor was called aside by a gentleman and entered into conversation with him. A minute or so elapsed, when to the surprise of the clerk, Mr. Smith, accompanied with his superb setters, as usual, dropped in after some shot. While the clerk was filling his order, the Doctor turning from his friend who went out, addressed the clerk in answer to his sally, and averred what he would do regardless of Everitt Smith.—Sir, my name is Everett Smith, and as you seem to be addressing your remarks to others, I inquire why you do not address me?" The Doctor's face thushed not a little, the clerk's countenance ditto, and an introduction and explanation followed. The Doctor was glad for one reason that it happened, because he now knows who the Game and Fish Commissioner was, and also that he believed Mr. Smith when he said that whoever broke the laws, be he whoever he may, persecution would follow if proof could be obtained.

Spectator.

RAIL SHOOTING.—New York, September 3d.—On last Tuesday evening I went to Hackensack to catch the first day of raibin'd shooting. I had some trouble in getting a pusher, as they were almost all engaged. In the morning at 520 the tide began to rise in the meadows, and we started. There were altogether about twenty-live boats out or starting at that time. The meadows, which are not more than a mile long and a quarter wide, were full of birds. I having 'a muzzle-loader, and missing the first nine birds, only got or shot twenty-one, four of which we could not find on account of the roeds being so thick. Other shooters with breech-loaders did not get less than thirty-live. It was very hard work for the pushers, the tide being so low and the reeds very strong and close. The sun also was very hot, it being altogether a very warm day. Under your heading of "Game Bag and Gim" I don't see any mention of rail. Are they known by any other name than that? As this is the first time I ever shot them I don't, of course, know much about them. If you have another name will you be so kind as to let me know through your paper? If any of your readers who cannot spare more than a day from their business want to go, they can take the 8:12 P.M. train on the Mildhar railroad from Jersey City. Whenahey get to Hackensack they can inquire for the Franklin House, where they can get a pusher and stay over night. If they wish a good pusher they can inquire for Qir. Leonard Terhune, who will give them a good day's sport, as he know wevery inlet and outlet in the meadows, upon which he has shot ever since he was a boy. Can you led! me where there is a good place for quail shooting

near here? I am a great lover of the sport, but I have not the means to go far, nor can I stay from my business more than two days at a time. Hoping I have not taken up too much of your time, I remain, G. E. J.

There is no quail shooting in this vicinity at this season

of the year.

A Practical Game Constable.—North Turrytoen, Sept. 5th.—Editor Forest and Stream:—In my opinion, the first step toward enforcing the game laws is to let people know the law. I would, therefore, suggest that each game protective association have a number of copies of the game laws printed in poster and hamibil form, which can be done at a small cost, and distribute the same among farmers and wherever they will do some good. It would also be well for the game protective associations throughout the State to see that good men are nominated and elected as game constables at the town elections in the spring of each year, for often there are men selected only to fill up the election ticket (and I know some that could not tell a partridge from a turkey, or a trout from a sucker). On the solicitation of some of my sportsmen friends I accepted the nomination and was elected to the office of game constable at the election of last spring. After I was sworm into office I made up my mind to enforce the game laws if it was a possible thing to do, and the first thing I did was to have the laws published in the local newspapers (a thing that I have done from time to time for a number of years), and then I had, at my own expense, 250 copies of the law printed in circular forn, and distributed the same among the farmers and wherever I thought they would do some good. It is satonishing to see how much interest a good many people take in the game laws since they know that there is some one looking after them. Some of the sportsmen hereabouts think that the season for woodcock should not open until Sept. 1st, instead of Aug. 1st, and I think they are right, for there are a good many particings short during August while men are lunning for woodcock.

The right man in the right place will always find some means of accomplishing a desired end. The way our

The right man in the right place will always find some means of accomplishing a desired end. The way our correspondent has gone to work to perform his task proves that he is the man for the position. With the game laws in simple, plain shape posted in the village post office, railway station, and in the baggage cars of the trains, no one can plead ignorance of the provisions.

Shooting Notes From Minnssota.—Fairmont, Minn., Sept. 1st.—Editor Forest and Stream:—The recent wholesale poisoning of bird-dogs in Cottonwood County, and the equivocal tone of the local press (notably The Windom Reporter) in regard thereto, are still topics of peculiar interest to non-resident sportsmen in Minnesota. True, the people of Windom, many of whom chuckled over the discomfiture of "them dandy sportsmen," are now changing their tone and explaining things away, as they begin to preceive that the dastardly act was also a lamentable blunder, for the owners of valuable dogs have not been slow to shake the nucl of Windom from their boots and seek their sport in less perilous regions. In future the pot-hunters of Windom will have things pretty much their own way, but the hotels and business houses of the village, as well as the neighboring farmers, will probably miss the ready cash which the average visiting sportsman lavishes so profusely during the hunting season.

probably miss the ready cash which will be hunting season.

[Note.—It has been maintained with a good deal of plausibility, that more money is annually brought into the State by sportsmen than the average net profit of the wheat crop will amount to.]

Prairie chickens are unusually abundant this year. Here in Martin County, notwithstanding a three weeks fusilade, the grouse seem as numerous as ever, while ducks and geese are already beginning to fly. All things considered, Fairmont is the best hunting center your correspondent has yet found. Its hotel (the Occidental), is probably the best in the Western country; new, spacious and well conducted, with good livery, and well posted drivers. Lucas, of St. Louis, is here with his famous Irish brace, Erin and Biddy. The St. Louis Kennel Club is camped a few miles south of, town. Sanborn, the breaker of Nellie, winner of last year's brace stakes at Patoka, is training some magnificent Llewellyns, among them Count Noble, Dashing Lyon and Little Lady, names which will probably be heard of hereafter. Whitford, late kennel master and trainer of the St. Louis Club, is also here, having with him some twenty dogs. The grouse in this section were rather early and are now full-grown. Their flight is about equal to that of a November quail, demanding fair skill on a thirty yard rise, and affording fine sport.

AN ADRONDACK TRIP,—Minerva, Essex County, N. V., August, 1880.—Leaving New York on the 11 P.M. train Monday last brought our party into Albany about 6 A.M. Tuesday, when we changed cars for Saratoga and again for North Creek, N. Y., via Adirondack Railroad, thence by private "buck board," sixteen miles, into the woods to our present log cabin, "Aiden Lair Lodge," where we are very comfortably cared for by the genial Tom Murphy, who does his utmost for the comfort and happiness of his guests. guests.

The past week has been devoted to fishing, with the ex-

The past week has been devoted to fishing, with the exception of one morning, when the dogs were started on a deer seent, and we were stationed at the different runways to the Boreas River and Long Pond. An old doe and fawn were started by the dogs, but they ran up the valley instead of down, as intended, so we did not get a shot, but we saw the tracks and unmistakable evidence of numerous deer within two miles of our "lodge."

Next morning, with Fred Loveland to guide, we start d to fish the Van De Whacken River, and such trout are not often seen as we brought back—one weighing one pound and a quarter, and six or seven more weighing from three-quarters to a pound each, besides the small ones from two or three ounces up. We brought back fourteen pounds of brook trout, all caught within a distance of two miles fishing on the Van De Whacken River.

tance of two nines using ...
River,
We fished one day on the Hewitt Pond (which is down
on Stoddard's map of the Adirondack Wilderness, and a
pretty accurate guide it is), where two speckled beauties
weighing four and one-half pounds were captured by

Messrs. Kilpatrick and Crane, of our party, together with about eight pounds of smaller ones, from a half pound upwards. The ponds about here abound with brook trout, not as one would suppose with the lake species. They are very saucy and take fly, minnow and bait very

They are very sauoy and the total of the promptly.

The gunning has hardly begun yet, so we have not had an opportunity of trying our hand on the partridge, woodcock or squirrel, which are quite plenty. Guide Loveland tells us that deer are more plenty this year than for many years past. For all who are sufferers from hay fever this is undoubtedly the place, for with cold nights and several frosts the air is pure and free from all that have these complaints.

J. G. C.

WISCONSIN—Fond Da Lac. Aug. 28th.—Game prospects in this section are not very flattering for grouse shooting. The season opened on the 15th, in this part of the Stae, and very meager results have thus far been reported. Ducks are reported quite plenty, but it is yet too early in the season to form any definite conclusions. The conflicting local interest in the last legislature made some very unwise amendments to the game law, that we hope will receive the attention of the State association before another session. An important and salutary amend-ment was secured to the deer law, and the shooting and shipping season is now limited to the months of Sep-tember, October and November, in each year.

We append the law, which, as amended March 15th-1990 reads :-

We append the law, which, as amended March 19th1850, reads:—
"Any person who shall take, catch, kill, destroy or
wantonly nodest, or have in his possession when killed or
taken, or exposs for sale in this State any woodcock been the 1st day of January and the succeeding 10th
day of July, and any quait, partridge, pheasant or ruffed
grous: parisine hen, or prairic chicken, sharp tailed grouse
or grouse of any other variety, or any woodduck, mallard
or teal duck, between the 1st day of January and the
succeeding 15th day of August in any year; or any
wild deer, buck, doe or fawn, between the 30th day of
November and the succeeding 1st day of September in
any year; or any ofter, mink, martin, muskrat or fisher,
between the 1st day of May and the succeeding 1st day
of November, shall be punished by fine not exceeding ten
dollars, nor less than one dollar for each bird or animal so
unlawfully taken, killed, had in possesion or exposed for
sale; provided, that the provisions of this act shall only
apply to that portion of the State lying north of the northern boundary line of the counties of Vernon, Sauk, Columbia, Dodge, Washington and Ozatwe."

umbia, Dodge, Washington and Ozaukee."

The Shattick Single-barrel Gun,—Olean, N. Y., Ang. 30th.—Editor Forest and Stream:—In a late issue of Forest AND STIEAM, you recommended the Shattack single-barrel breech-loading shot gun. Relying thereon (as I ought to), and induced thereby, I ordered a ten-bore, full choke, twist barrel, nine-pound gun. I have just targeted it, and am agreeably surprised at its effectiveness with a load of five drachms Orange rifle powder, C. G., one and one-quarter ounces Tatham's No. 9 shot (Dixon's gauge). I put 437 pellets by actual count into a twenty-four-inch ring at forty yards. The shot were handsomely distributed. Beside the shooting qualities of the piece, it is well made, the breech action being as solid and reliable as in the more expensive double guns, a point where most single breech-loaders are singularly weak. The action is novel and effective. The barrel is sprung by a forward trigger; the act of pulling this trigger raises the hammer to the safety notch before the barrel is released, doing away with the intraceies of the relounding look and being equally as effective, accomplishing the same purp-se with greater simplicity, and no resistance irom a rebounding spring to the direct blow of the hammer. Altogether, I am more than pleased with the gun, and I think I have found the long-sought-for single-barrel breech-loader that it will do to swear by.

Moddoc.

ADIRONDACKS.—The Syracuse, N. Y., Courier records the Adirondack shooting of Mr. Fred, Howlett, of that city, who is spending a couple months in the North Woods, near Cranberry Lake, and who has the distinction of having brought down the biggest game yet reported from the wilderness—a cub and a she bear. The skin of the old bear will be converted into a robe and the only will be turned over to a taxidermist. Mr. Howlett is skilled in the use of the gun, and as the result of his accurate aim the beads of two fine bucks are being set

up for him.

PISTOL ARMS.—Rochester, N. Y., Aug. 25th.—Permix me to suggest to gummakers that there is a kind of fire-arm not made here, but for which there would undoubtedly be a demand. I mean a fine grade single barrel pistol. Our revolvers are as good as can be wished for, and there are some straight shooting single barrels manufactured. But I have never seen my idea of what a single barrel pistol should be. The barrel should be Damascus or some other handsome twist, no more than six or seven inches in length, and the stock, instead of the common angular stock, ought to be full rounded and finely checkered. It should have open sights. Such a weapon, made to take the modern cartridge, would be popular for target and other shooting.

E. R.

THE CITY OF WORCESTER .- Worcester, Mass., THE CITY OF WORCESTER.—Worcester, Mass., Sept. 7th.—The excursion car City of Worcester started 9:55 this morning, for a trip to Iowa and Nebraska, with a shooting party, including Mr. and Mrs. Jerome Marble. Mr. and Mrs. C. C. Houghton, Mrs. A. B. F. Kinney and daughter, Rev. J. A. Cass and Mr. H. Honghton, or this city; Mr. W. H. Hutchinson, of Lynn; Messes, J. H. Lansing and John Babcock, of Boston; Mr. Frank E. Simpson, of Saxonville; Mr. F. L. Sturtevant, of Framingham; Mrs. Reynolds and daughter, and Miss Sherry, of Minnecultic Mine.

Affections and dangher, and also shelly of admis-ajobis, Minn.

The ear has been thoroughly renovated for the trip, and has received a new set of steel wheels. The old ones are not worn out, but the managers propose to secure perfect safety if possible, and have put in the new ones that the risk of the trip may be as light as possible.

CANTON GUN CLUB.—Conton, N. Y., Aug. 4th.—Our Gun Club" is but a small one, but we hope that it may grow. Two years ago we started one—all the members were officers—it died out. This one we thought to make

very simple in organization, and see if it would live. It has only a President, Secretary and Treasurer. President, A. F. Nims; Secretary und Treasurer, J. H. Rushton. At present, twenty members, all of Canton. Capt. Bogardus is to be here, Sept. 15th and 16th, at the county fair. Our club only take the management of it on the ground, and raise a portion of the needful by subscription. We hope to eventually number more and better men, and thought a visit from the champion would help us as well as the society fair.

help us as well as the society fair.

CAPT. BELL'S PANTHER STORY.—New Orleans, Aug. 28th.—Having read with interest the many wonderful feats performed by knights of the "Rod and Gan" in your columns, I have concluded to add my mite to the list, as it is somewhat different and truly remarkable. Capt. Bell. of Yazoo County, Miss., a highly respected gentleman, informed the writer that he killed and disabled six panthers at one shot. He was hunting in a boat and came upon the animals quietly occupying a little knoll during the overflow, all huddled together and in good range. Game prospects are very fine this seasean. The L. W. R. R. is now completed, which opens the Attakapas region (fine snipe and plover grounds) to the sportsman. the sportsman.

California Sporting Itams.—The Sacianiento, Cal., Bee corrects a previous statement, as follows: "We referred recently to the killing of a doe by Judge Hundley, of Butte county, and stated that the ferocions animal was about to bite him. We now learn that the Judge shot at a buck, about ten yards to one side, but accidentally hit the doe." The Bee is doing a good work in creating and sustaining a correct tone among its sportsuner readers. We note the formation of a new Sacramento club, who have adopted the name of the Roosevelt, of New York, who has, it appears, earned a trans-continental fame by his work as a protector of game. The President of the club is Mr. Charles E. Mack, Jr.

Fraser of the Cure.—A gun club was organized on the 20th instant at New Westminster, British Columbia, being the first organization of the kind on the mainland of British Columbia. Mr. J. C. Hughes was elected President and Mr. W. H. Keary, Secretary and Treasurer. A Card rotary trap has been procured, together with a supply of Paine's feather-filled balls, and practice will be commenced at once. Should there be any matches, a report will be sent to your paper. At the first meeting Mr. T. C. Banks was unanimously elected an honorary member.

W. H. Keary.

BOGARDUS AND THE LITTLE BOGARDI.—We commend BOGARDUS AND THE LITTLE BOGARDL—We commend to the attention of students of heredity the new programme just issued by Capt. A. H. Bogardus. It announces that Eugene (aged fifteen?), "will do all kinds of fancy shooting with a rifle," and that "Ed., Peter and Henry, aged respectively ten, seven and five years, will shoot with a rifle at a target and glass balls. Each of the boys will shoot a glass ball out of their father's finzers with a rifle." Then Capt. Bogardus himself, with patriarchal samp fruid "will shoot with a rifle, nickles from each of the boys' fingers, knock the ashes from a cigar held in Eugene's mouth, soulf a candle held by Henry."

SNIPE.—Hoboken, N. J. Sept. 2d.—This morning Max Wenzel opened the ball by killing the first Wilson snipe on our meadows.

#### SHOOTING MATCHES.

FRANKLIN, N. F., Sept. 2d.-The Ouleout Sportemen's Amountstion, of Franklin, held on their grounds, Sept. 1st, their regular badge shoot. Following is the score of the contestants; Bogardus Rutherford 4. Second Re, D. Harris 3, W. Rutherford 5. Third tle, D. Harris 2, W. Rutherford 5. Mr. Rutherford won by break-ing 33 out of a possible 25.
WESTBOROUGH, Mass. Sept. 4th.—To-day occurred the second annual field day of the Westborough Sportsmen's Club at Lake

Chauncy Grove. There was a large delegation from the sports-man's clubs in the surrounding towns, as follows: Natick, Hop-kinton, Holliston, Medield, Milford, Worcester, Franklin, Mari-boro. The delegates from the above places were received by the Westborough Club at an early hour this morning and escorted to weetorning trouch a learny nour us anothing indeescored or the shooting grounds, some 2 miles from the village. A finer day could not have been had, although the hot rays of the sun drove those who were not shooting under the large pine trees for shade. The forenoon was spent in a general shoot for sweep-stakes by all. The afternoon work for the marksmen was a town stakes by all. The afternoon work for the marksmen was a toam shoot for the following prizes, 6 in number: First. 815; second, \$9; third, cartridge box, presented by W. R. Shaefer, of Boston; fourth, \$8; fifth, shooting coat, presented by P. J. Lovell; sixth, a 6 barrel revolver. Range, 16 yards from totary trap and at 10 balls, they having 2 traps about 300 yards apart, and 5 balls to be shot from each trap. In the shooting, the first Worcester team carried off the honors and first prize, making 28 balls out of a possible 30. The second was divided between the first Westborough and the second Worcester teams. The second Mariboro team won this force was already to be second Westborough. third prize; the fourth was given to the second Westborough

third prize; the fourth was given to the second Westborough, fifth prize to the Holliston team, and the sixth to third Westborough team. The following is the score:—
Milford—First team.—W. R. Devett &, J. C. Wescott &, A. H. Harris &; total, 18. Second team.—C. B. Fletcher &, J. Hunting 3, L. B. Barrows &; total, 13. Third team.—G. N. Whitney &, T. L. Martin 5, J. C. Lotal, 17. Westborough—First team.—J. B. Clark 10, W. B. Rice 10, G. N. Smalloy &; total, 28. Second team.—C. H. Harrington 9, F. Forbes 9, W. B. Clark &; total, 24.

 W. H. Clark 6; 10141, 23.
 Third team.—J. B. Morse 6, O. F. Wills-low 7; J. Jackson 7; 101al, 22.
 Mariboro—First team.—F. J. Beaudry 9, J. G. Howa 6, W. A. Leighton 10; total, 25.
 Second team.—H. W. Eager 10, Dr. Chamberlin 6, H. S. Fay 9; total, 25.

berlin 6, H. S. Fay 9; total, 25.
Natigk—First team.—M. Brigham 10, G. R. Bigelow 6, C. W. Gile 8; total, 24.
Second team.—E. B. Bigelow 8, Dr. J. H. Wright 7, G. A. Leach 9; total, 24.
Worcester—First team.—C. B. Holden 10, J. G. Rugg 9, U. S. Perry 9; total, 28.
Second team.—E. P. Smith 9, L. E. Hudson 10, J. G. White 7; total, 26.

Holliston team,-E. S. Cass 7, W. C. Kelly 8, O. Joslin 8; total,

Franklin team,-J. P. Farmer 8, E. Wales 7, L. Dean 8: total, 21, MANCHESTER, N. H., Aug. 23th,—Regular weekly shoot of the Manchester Shooting Club; Card rotary trap, 13 yards rise, 10 balls ench. VINCENTOWN, N. J., Sept. 1st.—The Conxen Glass Ball Club held the'r monthly shoot there to-day for silver badge. Card's trap, 18 yards rise, 10 balls. The secores are as tollows: F. S. Hillard 8, W. D. Haines 8, W. J. Frick 4, S. S. Butterworth 7, W. S. Hillard 6, R. H. Lrick 8, J. W. Haines 6. Ties shot of at 3 balls; W. D. Haines 111-010, R. H. Frick 011, F. S. Hilliard 111-011. Hilliard won hadge. SHELDRAKE.

WOODLAWN, N. Y., Ang. 27(h.—There was quite a lively shoot Friday, Aug. 27(h. gotten up by Messrs. Nichols and Adams, of Bridgeport, Conn. Some of the boys from New Haven and Meri-Hingeport, Conn. Some of the logs from Now Haven and Meri-den were expected, but none came, only Brogden and Post from Wallingford; 5 birds first sweep, class shooting: Brogden 4. Tice 3. Adams 4. Gralper 2, Post 3, Varian 4, Nichols 4, Link 4, Weeks 4. Nichols and Brogden divided. The for second, miss and out, won by Post.

Straight sweep, 5 birds: Brogden first, Adams second, A. Ward

third.
Third shoot, class: E. Ward. A. Ward and Brogden divided first.
Tie for second divided by Link and H. Nichols.
DIANA SPORTSMEN'S CLUB.—Holloken, N. J., Sent, 2d.—A lively

and interesting match took place yesterday between some mem-bers of this club. Weather being fine and birds tolerably good figers. The following score was made; 10 birds: Sarhau Hanner 5, Junk 5, Bruckner 6, J. Berkery 8, Hlnokens 5, V. Altenbeim 5.

SPARTANBURG, S. C.—The report of the Spartanburx shooting ournament has been unavoidably deferred until our next issue.

#### MODERN COCKER SPANIELS.

MODERN COCKER SPANIELS.

Editor Forest and Stream:—
Having noticed within a short time back several little articles upon cocker spaniels in your columns, as well as in one of your contemporaries, I would with your permission like to add a word also; and only a word or two, for I will endeavor ere long to write more extensively upon the various types of cockers and field spaniels, and give their characteristics, modes of breeding, etc., etc., which I find there is such an increasing desire for information upon. Having constantly handled and bred the various breeds, types and strains of spaniels from a child, perhaps, I may be excusable for the curp hatin manner in which I give any ideas as facts. Trusting that such will be the case, I must state my surprise when reading "ibex's" article in a late issue of your paper upon "cockers for cover shooting," where he advocates the advantage of apparent water spaniel blood for work here in the North. Experience has taught me that the modern cockers, suitable for rough American work (which he must know, are the old style cockers judicously bred to the old Sussex type or breed, and a happy medium obtained thereby, varying in size from about twenty-four to about twenty-eight pounds, and retaining a trife more of the shape and style of the old cockers) have all the desired qualifications of pluck, bardiness and retrieving qualities necessary; and where the water spaniel blood shows apparently you are usually-certain to find a little too much business in one hide. Perhaps "ibex" intended to say the extrema North, near our great lakes, and not the North or South, as is usually spoken of or understood

as such. Now, as to the size or weight of our modern cockers, I think that thirty pounds should be called the limit, although twenty-five to twenty-eight pounds is of course preferable for work, and even as light as eighteen to twenty pounds, where desired mostly for pets and house dogs, is admirable. This is an age of improvement, and cockers are better to-day than ever before, and certainly nothing could have been done to improve their usefulness for American work, more than the increase of their size, bone and muscle, from the old eighteen to twenty pounds breed to the present twenty-five to twenty-eight pound ones. I have repeatelly found that in measuring the finest modelled specimens of the breed that twice the longth at fore shoulders is the almost exact length from end of nose to root of tail, and an inch and a half or two inches either way detracts from the dog's beauty and usefulness. The hair should not be curled, but wavy and silky, neither should it be fiat, as some advocate, although I have seen fine specimens with coats perfectly flat; but I always look rather suspiciously upon such. The tail, ears, breast, legs and belly should be well feathered with nearly straight hair, rather coarser than their body coat. As to the standard color, or truest color, in spanies, I am aware that I shall differ from many who consider themselves competent judges, for I consider liver with no white, or with white ruffle in bosom, the genuine color originally of the spaniel race, or perhaps liver and white ticked has nearly as good a claim, but black, or black and white, or black and tan, are certainly introduced colors, and do not belong to the cocker at ali, and especially the modern cocker as it should be: although many have adopted this color and indired and interbred them until they scarcely showed the foreign blood; but this color has never given satisfaction to its breeders, or benefitted the ocker race, and I am certain it never will reach the standard of perfection that the old standard liver, or liver and w

#### J. H. WHITMAN'S KENNEL

J. H. WHITMAN'S KENNEL.

J. H. WHITMAN'S KENNEL.

Whitman, of Chicago, a gentleman of large railroad experience, having been connected with one of the leading Eastern lines for inteten years as manager of their passenger business from the West. From him we received much valuable information regarding the most noted resorts of sportsmen during the open season. By his invitation we visited his kennel of fine dogs for sporting purposes; feeling your readers might like some idea of his stock, we take the liberty to say that when shows were first inaugurated he was one of the most prominent parties in establishing them. His dog Grouse, a handsome lemon and white dog, took the first prize ever given at a show in this country; this was at the Dexter Park, where a number of sportsmen were holding a pigeon shoot, having agreed to bring their dogs for friendly competition. Soon after, a large show was given in Exposition Building, Chicago, where Grouse won first prize as the best stock dog exhibited. Of this dog Mr. Whitman never fails to speak; he considers him equal to any he has owned since; still keeping the breed, and crossed with recent importations of field trial, or Lavreack setters, he claims there are none superior. When the rage for claiming names for dogs through the columns of sporting papers first originated, he claimed the name for this breed of prairie rangers, by which they are known in the West; he has now two dogs and one blich which he prizes very highly. Prairie Ranger, Prairie Joe, Prairie Fly are the names; they are by the pure Laverack setter Charm, out of Pearl, a daughter of Grouse, and Valentine's Nelly both noted wherever known for their extra field qualities. Ranger is a large fine looking animal, pure white with the exception of lemon ears. Joe is also large lemon and white ticked, with dark eyes and nose. Fly is much smaller, but equally well made. In examining these dogs it was plain to be seen that in muscular development they were very superior; fine glossy coats, legs and feet that look

kennel. Blue Dash, a handsome blue belton setter, by Pride of the Border and Dora, is a grand dog all over, and very intelligent. He is of the Laverack form, and to look at him one would think he was slow, yet he is equally fast with the best, and his endurance is beyond question. We were astonished at his intelligence, seeming to understand exactly every order given him, which he cheerfully obeyed; he is the pct of the family, with whose little daughter he likes to be most of the time. Blue Drake, his son, out of pure Laverack setter Diamond, is marked exactly like him, and although young, will when fully developed be fully his equal in all respects. Nelly May, a daughter of Blue Dash out of Jolly May, is yet yohng, only nine months old; she has a black and white head and blue ticked body; she goes into breaker's hands this fall, promising to sustain the reputation of her sire. Pride, Judy and Flora are by Charm out of a lemon and white hat with the pride and Judy are fully trained, as one could plainly see by their actions in a field where they were shown. Prairie Queen is a large, fine bitch, with very fine head, long neck, and grand body; she was in whelp to Charm. She is litter sister to Prairie Belle, winner of first prize at Minnesota Field Trials; also to Prairie Rose, winner of second prize at Nashville. Milley is a very fine white bitch with ticked body; she is by the noted Rob Roy out of Waddington's Daisy. She was secured to breed from, her progeny having been not only handsome, but extra good in the field. Film is a long, clean cut and game looking bitch, white with lemon on head; was bred by Geo. Waddington, out of Milley. Clexton, her brother, is one of the grandest young dogs we have seen; he has not yet been trained, but shows wonderfully well in the field, and goes into training next week. He is liver and tan head, liver spots on side, balance white; these are by Druid. It will be seen that no better combination of blood can be found in any kennel; and these animals show fine care. Mr. Whitman

#### ENGLISHE DOGGESS

The fifth Section of this

Containing Curres of the mungrell and rascall sort and first of the Dogge called in Latine, Admonitor and of vs in Englishe VVappe or VVarner.

or VVarner.

Fisheh doyges as keep not their kinde, of such as are mingled out of sundry sortes not imitating the conditions of some one certaine spice, because they reseble no notable shape, nor exercise any worthy property of the true perfect and gentle kind, it is not necessarye that I write any more of them, but to banishe them as vn-profitable implements, out of the boundes of my Booke, rupprofitable I say for any use that is commendable, except to intertaine strangers with their barcking in the day time, gitting warnyng to them of the house, that such & such be newly come, wherevpon wee call them admonishing Dogges, because in that point they performe theyr office.

Of the Dogge called Turnespete in Latine Verunersator

There is comprehended, vnder the curres of the coursest kinde, a certaine dogge in kytchen seruice excellent. For whe any meate is to bee roasted they go into a wheele which they turning rounde about with the waight of their bodies, so diligently looke to their businesse, that no drudge nor skullion can doe the feate more cunningly. Whom the popular sort herevpon call Turnespets, being the last of all those which wee haue first mencioned.

Of the Dogge called the Daunser, in Latine Saltator or Tympanista.

Sallator or Tympanista.

There be also dogges among vs of a mungrell kind which are taught and exercised to damnee in measure at the musicall sounde of an instrument, as, at the inst stroke of the drombe, at the sweete accent of the Cyterne, & tuned strings of the harmonious Harpe showing many pretty trickes by the gesture of their bodies. As to stand bolte upright, to lye flat vpon the grounde, to turne rounde as a ringe holding their tailes in their teeth, to begge for theyr meate, and sundry such properties, which they learne of theyr vagabundicall masters, whose instrumenest shey are to gather gaine, withall in Citie, Country, Towne, and Village. As some which carry olde apea on their shoulders in coloured tackets to moue men to laughter for a litle lucre. moue men to laughter for a litle lucre.

Of other Dogges, a short conclusion, wonderfully ingendred within the coastes of this country.

Three sortes of them.

The sortes of them, The scond or a bytch of them.

The scond or a bytyche and a roke. The third of a beare and bandogge,

The drift of a beare and bandogge,

F the first we have none naturally bred within the borders of England. The reason is for the want of wolfes, without whom no such kinde of dog can bee in-

\*Of Englishe Dogges, | the diuersities, the names, | the natures and the properties, | A Short | Treatise written in latine | by Johannes Chitis of late ment | ric, Dottor of Phistoke | In the Unitaries | the properties | the p

gendred. Againe it is deliuered unto thee in this discourse, how and by what meanes, by whose benefitte, and within what circuite of tyme, this country was cleerely discharged of ranenyng wolves, and none at all left, no, not to the least number, or the beginning of a number, which is an Vuari.

Of the second sort we are not viferly voyde of some, because this our Englishe soyle is not free from foxes (for in deede we are not without a multimale of them in so much as diuerse keepe, foster, and feede them in their houses among their houndes and dages, cyther for some naladie of mind, or for some sicknesse of body.) which peraduenture the savour of that subtill beast would cyther mitigate or expell.

peraduenture the savour of that subtill beast would eyther mitigate or expell.

The thirde kinde which is bred of a Beare and a Bandogge we want not heare in England.

And why should not this bee consonant to truth? why shoulde not these beastes breede in this lande, as well as in other forreigne nations? For wee receie that Tigers and dogges in Hircenia, that Lyons and Dogges in Arcadia, and that woifes and dogges in Francia, couple and procreate. The Vreang which is bred of a beare and a dogge.

And byteth sole to fleshe and stronge, And byteth sole to fleshe and hone, His furious force indureth longe In rage he will be ruf de of none

In raze he will be rui'de of none.

That I may vise the wordes of the Poet Gratius. This dogge exceedeth all other in cruell conditions, Lis leering and fleering lookes, his stearne and samage vissage, maketh him in sight feareful and terrible, he is violent in fighting. & wheresoeuer he setteth his tenterhooke teeth, he taketh such sure & fact holde, that a man may sooner teare and rende him in sunder, then lose him and separate his chappes. He passed not for the Wolfe, the Beare, the Lyon, nor the Bulle and may wortherly (as I think,) be companyio with Alexanders dogge which came out of India. But of these, thus much, and thus farre may seeme sufficient.

A starte to outlandishe Dogges in this conclusion, not impertinent to the Authors purpose.

No imperment to the radious purpose.

Vise and custome hath intertained other dogges of an outlandishe kinde, but a fewe and the same beying of a pretty bygnesse. I meane Iseland, dogges curied & rough all outer, which by reason of the length of their heare make shows neither of face nor of body. And yet these curres, forsoothe, because they are so straunge are greatly set by, esteemed, taken vp, and made of many times in the roome of the Spaniell gentle or conforter. The natures of men is so mouved, nay rather marryed to nouelties without all reason, wyt, indigement or persenerance. Eromen allotrian, parorimen sungeneis,

contlandishe toyes we take with delight Things of our owne nation we have in despight

outstandshe toyes we take with delight.

Outstandshe toyes we take with delight.

Which fault remaineth not in vs concerning dorges only, but for artificers also. And why? it is to manyfest that wee disdayne and contempne our owne workinen, be they neuer so excellent, be they neuer so skilfull, be they neuer so cunning. A beggerly beast brought out of barbarous borders, fro' the vitermost countryes Northward, &c., we stare at, we gase at, we muse, we maruaile at, like an asse of 't'manaum, like Thales with the brasen shaneks, like the man in the Moone.

The which default Hippocrates marched when he was advue as enidently appeared in the beginning of his booke Peri Agmon so intituled and named:

And we in our worcks entituled De Ephemenu Britanica, to the people of England have more plentifully expressed. In this kinde looke which is most blocklishe, and yet most waspishe, the same is most esteemed, and not amonge lustic Lordes also, and noble men, and daintie courtier rulling in their ryotous ragges. Further I am not to wade in the foorle of this discourse, because it was my purpose to satisfie your expectation with a short treatise (most learned Conrade) not wearysome for me to to wryte, nor tedious for you to peruse. Anong other things which you hatte receated at my handes heretofore, I remember that I wrote a seuerall description of the Getallian Dorge, because there are but a few of them and therefore very seldome scene. As touching Dorges of other kyndes you your selfe haue taken earnest paine, in writing of them both lyuely, learnedly and largely. But because wee haue drowne this libell nore at length then the former which I sent you (and yet briefer than the nature of the thing myght well beare regarding your more earnest and necessary studdies. I will conclude makyng a rehearsall notwithstanding (for memoryes sake) of certaine specialities contayined in the voloe body of this my breuiary. And because you participate principal pleasure, in the knowledge in the common and vsuall names of Dogges (as I gath

A Diall pertaining to the

Fifte Section.

Dogges contained in mer, mer, incr., the furnesspet, are the dauncer, the dauncer,

A Supplement or Addition contai-

ning a demonstration of Dogges

names how they had their

Originall.

The names contagned in the generall table, for so much as they signifie nothing to you being a straunger, and ignoraunt of the Englishe tounge, except they be interpreted: As we have given a reason before of ye latine words so mean we to doe no lesse of the Englishe, that every thing maye be manyfe-t unto your vnoiestanding. Wherein I intende to observe the same order which I have followed before haue followed before.

The names of such Dogges as be contained in

the first section.

the first section,

Agax, in Englishe Hunde, is deriued of our English liunte. One letter chaunged in another, namely T, into D, as Hunt, Hunde, whom (if you coniecture to be so named of your country worde Hunde which signifieth the generall name Dogge, because of the similitude and likenesse of the wordes I will not stand in contradiction (friend Gesner) for so muche as we retaine among vs to this day many Dutche wordes which the Sazons left at such time as they occupyed this country of Britane. This much also vnderstand, that as in your language Hunde is the common word, so in our naturall tounge dogge is the vninersall, but Hunde is perticular and a speciall, for it signifiesth such a dogge onely as serueth to luunt, and therefore it is called a hunde.

Of the Gasehound

#### Of the Gasehound,

Of the Gasehound, The Gasehound, The Gasehounde called in latine Agaseus, hath his name of the sharpnesse and stedfastnesse of his eyesight. By which vertue he compasseth that which otherwise he cannot by smelling attaine. As we have made former relation for to gase is earnestly to viewe and beholde, from whence floweth the derivation of this dogges name.

#### Of the Grehounde.

The Grehounde called Leporarius, hath his name of this word, Gre, which word soundeth Gradus in latine, in Englishe degree. Because among all dogges these are the most principall, occupying the chiefest place, and being simply and absolutely the best of the gentle kinde of bounder.

#### Of the Lenyuer or the Lyemmer.

Of the Lenyuer or the Lyemmer.

This dogge is called a Leuyner, for his lightnesse, which in latine soundeth Leuilus. Or a Lyemmer which worde is borrowed of Lyemme which the latinists name Lovum: and wherefore we call him a Leuyner of this worde Leuilus (as we doe many things besides) why we deriue and drawe a thousand of our tearnes out of the Greeke, the Latine, the Italian, the Dutch, the French, and the Spanishe tounge: (Out of which fountaines indeede, they had their original issue). How many words are buryed in the grave of forgetfulness? growne out of vse? wrested awrye and peruersly corrupted by diuers defaultes? we wil declare at large in our booke intituled, Simphonia rocum Britannicarum. vocum Britannicarum.

#### Of the Tumbler.

Of the Tumbler.

Among houndes the Tumbler called in latine Vertagus, is the last, which commeth of this worde Tumbler flowing first of al out of the French fountaine. For as we say Tumble so they Tumbler, reserving one sense and signification, which the latinists comprehende vnder this worde Vertere, So that we see thus much, that Tumbler commeth of Tumbier, the vowel, I, chaunged into the Liquid L, after ye maner of our speache, Contrary to the French and the Italian tounge. In which two languages, A Liquad before a Vowell for the most part is turned into another Vowell, As, may be perceaued in the example of these two wordes, Impliere & plane, I, and L, before A, turned into I, also. This I thought convenient for a taste.

The names of such Dogges as be contained in the second Section.

A Fter such as serue for hunting orderly doe follow such as serue for hawking and fowling. Among which the principal and chiefest is the Spaniell, called in Latine Hispaniclus, borrowing his name of Hispaniclus Spaine, wherein wee Englishe men not pronouncing the Aspiration H, Nor the Vowell I, for quicknesse and redinesse of speach say roundly A Spaniell.

#### Of the Setter.

The second sorte of this second division and second section, is called a Setter, in latine *Index*, Of the worde Set which signifieth in Englishe that which the Latinistes means by this word *Locum designare*, ye reason is rehersed before more largely, it shall not neede to make a new repetition.

#### Of the water Spaniell or Finder.

Of the water Spaniell or Finder.

The water Spaniell consequently followeth, called in Latine Aquaticus, in English a water spaniell, which name is compounded f two simple wordes, namely Water, which in Latine souldth Aqua, wherein he swymmeth. And Spanie Hispania, the country fro whence they came, Not that England wanted such kinde of Dogges, (for they are naturally bred and ingendred in this country.) But because they beare the generall and common name of these Dogges synce the time they were first brought ouer out of Spaine. And wee make a certaine difference in this sort of Dogges, eyther for some thing which in theyr voyce is to be marked, or for something which in their qualities is to be considered, as for an example in this kinde called the Spaniell by the apposition and putting to of this word water, which two completed by the findeth such things as be lost, which word Finde in Englisho is that which the Latines meane by this Verbe funerite. This dogge hath this name of his property because the principall point of his seruice consisted in the premises.

The names of such Dogges as be contained in the thirde Section.

the thirde Section.

Now leaving the seruie we of hunting and hauking dogs, it remaineth that we runne ouer the resistance, whereof some be called, fine dogs, some course, other some mungrels or rascalls. The first is the Spaniell gentle called Canis Metileus, because it is a kinde of dogge accepted among gentles, Nobles, Lordes, Ladies, &c., who make much of them vouchsafeing to admit them so farre into their company, that they will not onely full them in they lappes, but kysse them with their lippes, and make them they prettie playfellows. Such a one was Gorgons litle puppie nencioned by Theoceritus Siracusis, who taking his iourney, straightly charged and commaunded his mayde to see to his Dogge as charely and warely as to his childe: To call him in alwayes that he wandred not abroade, as well as to rock the babe a sleepe, crying in the cradle. This puppity and and peasantly curre, (which some frumpingly tearme fysteing hounds) serue in a maner to no good viee except, (As we haue made former relation) to succour and strengthen quailing and quamming stomackes.

The names of such dogges as be contained in the fourth Section.

the fourth Section.

F dogges vinder the courser kinde, we will deale first with the shepherds dogge, whom we call the Banderge, the Tydogge, or the Mastyne, the first name is imputed to him for service Quonium pastori Janualdur, because he is at the shepherds his masters commaundement. The seconde a Liguanetio of the band or chaine wherewith he is tyed. The thirde a Sagina, of the farnesse of his body.

For this kinde of dogge which is vsually tyed, is myglity, grosse, and fat fed. I know this that Augustinus, Niphus calleth this Muslinus (which we call Mastinus.) And that Albertus writeth how the Lagiscaus is ingendred by a beare and a wolfe. Notwithstanding the self same Author taketh it for the most part pro Molosso. A dogge of such a countrey.

The names of such dogges, as be contained in

The names of such dogges as be contained in the fifte section.

the fifte section.

OF mungrels and rascalls somewhat is to be spoken, Andamong these, of ye VVappe or Turnespet which name is made of two simple words, that is of Turne which in Latine sounderh Vertere, and of spete which is Veru, or spete for the Englishe word inclineth closer to the Italian imitation: Verunersatur, Turnspet. Ho is called also VVaupe, of the naturall noise of his voyce IVau, which he maketh in barcking. But for the better and the redyer sounde, the vowell, u, is channed into the cosonant, p, so y for wanpe we say wappe. And yet I wot well that Nonius borow his Baubari of the natural voyce Bua, as the Greecians doe their Bonssin of wan.

Now when you understand this that Salture in Latine signifieth Dansare in Englishe. And that our dogge thereypon is called admisser and in the Latine Salture, and now suppose I, there remainent nothing, but that your request is fully accomplished.

The winding vno of this worke, called the Supplement, &c.

The winding vp of this worke, called the Supplement, &c.

The winding vpof this worke, called the Supplement, &c.

Thus (friend Gesner) you haue, not only the kindes of our countrey dogges, but their names also, as well in latine as in Englishe, their offices, services, diuersities natures properties, that you can demannde no more of me in this matter. And albeit I haue not satisfied your minde peraducture (who suspecteth al speede in the performatione of your requeste employed, to be meere delayes) because I stayde the setting fourth of that imperfect pamphlet which, fine yeares ago, I sent to you as a prituate friende for your own reeding, and not to be printed, and so made common, yet I hope (hauing like the beare lickt oner my younge) I haue waded in this worke to your contentation, which delap hath made somewhat better and deuterni Phrantitics, after witte more meete to be perused.

The ende of this treatise.

The ende of this treatise.

#### FINIS.

Dog Notes from Minnesota.—In Camp near Fairmont, Martin County, Minn., Aug. 21st.—I have been here a week now, and with Whitfort, who is encamped at this place. He is training the St. Louis Kennel Club dogs. He has Lena, Trap, Viking, Trinket and Keswick at work on chickens. Keswick is a wonderful animat; she goes like the wind, but her gait is so smooth and even that running seems to cost her no exertion. She has a remarkable nose, and is as stanch as any dog you ever saw. Now that she is worked down to good running condition, you can see her anatomy, every cord and muscle, as well as if she were skinned. I never saw such a display of muscle on a dog. Viking and Trap are doing splendid work and will be hard to beat at the field trials.

trials.

Mr. Lucas is here with his brace of Irish setters, Erin and Biddy. I have noticed that doggy men have been giving Irish setters the go by, lately, but if there are any, other dogs that can equal this brace. I should like to see them. I have shot over them for four days, and they are faultless in their work. Perhaps some would not like their quiet way of working, and would prefer the slash and dash of a big pointer or an English setter. I admit that these dogs are not showy, but they find as many birds as any; point, back, drop to wing and shot, and retrieve without ever doing wrong. For several days they have done the work for three guns, and never lost a dead bird. Part of the time four guns have been shooting over them, and got plenty of work.

Dash III. is here and Countess May, in Whitford's charge. Dash is a slashing dog, but does not work as well as May. May shows splendid qualities, but needs a great deal of work to sober her down. Mr. Sanborn is at Fairmont with several puppies in training. Messrs. Orth and Wilson, of Pittsburg, are with him. The country is a pleasant one to shoot over and birds are very abundant. I will write'again in a few days. Mr. Lucas is here with his brace of Irish setters, Erin

A HINT AS TO ANATOMY—Country Farm, Spottsylvania County, Va., Aug. 25th.—Editor Forest and Stream:—I have no disposition whatever to scratch open the Cathery dog scratching subject, to which ample justice has been done in Forest and Stream;—I have no disposition whatever to scratch open the Cathery dog scratching subject, to which ample justice has been correspondent, a "notary public," who wrote from "Wauseon, Ohio," upon this matter, to whom, with your permission, I should be pleased to put a question or so. Your correspondent says with regard to this dog scratching business, "I would suggest that the question would be harder if amended to read: Did any one ever see a dog scratch his left fore shoulder with his right hind leg while standing up?" Now, what I wish to know is this is it always the way with well bred Ohio dogs for it is of this class only the notary writes) that they scratch themselves with their legs, or do they not sometimes scratch with their paws? In Virginia dogs paws are, so far as I know to the contrary, ever armed with claws, and I was under the impression they were purposely given them to scratch with. I would like also to know if it is a fact that Ohio dogs scratch their hind shoulders with their legs or paws either lying or standing? Although Virginia has furnished your great bench show, Mr. Editor, with one of its judges for the last two years, I am satisfied we are much behind the times with regard to the anatomy of both dogs and horses. It has only been a few weeks since I observed in an editorial which ap-

peared in one of our great sporting papers the editor told us of the foreshoulders of a horse,

BIRDSHOT.

Confess, he hath thee here.

Confess, he hath thee here.

A RETHEVER'S INTELLIGENCE.—St. Leonard, P. Q., Aug, 9th.—A friend of mine, Mr. W., owns a very intelligent retriever bitch. A farmer near by killed a pig, and at night left the head upon a stump near the house. In the morning the pig's head had disappeared. My friend and his dog coming by, the man mentioned to him his loss, Mr. W., turning to his bitch, said: "Pup, have you stolen the pig's head? Go right away and bring it back, you bad dog." The bitch slunk away into the woods, and in a short time returned carrying the missing pork, which she immediately dropped before the farmer, then turning bolted for home at her best speed, and hid for the remainder of the day. Upon another occasion a daughter of Mr. W. started one evening to visit a neighbor at a little distance, carrying with her a lighted lantern. Arriving at the house she left the lantern outside in the porch. Soon afterward the bitch started out to find her young mistress, but I suppose she found first the lantern, and recognizing it as family property she took it up carefully and brought it home. As she entered the house with it alight, Mr. W. directly ordered her to "take it to Mary," and she then carried it hack to the neighbor's house, scratched at the door until it was opened, and walked up to the young lady with the lanters still alight. Now a hot lantern is not the most comfortable sort of thing for a dog to carry.

Pup is first-class for duck shooting, obeying the slightest motion of the hand.

est motion of the hand.

A Dog Tanner,—Concurrently with the forty days' fast of the misguided American doctor, another fast has been in progress in our own country, for the truth of which I myself can youch. A friend of mine, who lives in Devonshire, left home some weeks since on a series of visits to his friends in distant parts of the country. A few days after he left, his servants wrote him that a favorite skye terrier was missing. My friend, after every search had proved fruitless, considered that the dog had been stolen. On his return home, after an absence of one month and five days, he unlecked the library, the drown and windows of which had been bolted and harred during his absence, and to his astonishment the missing dog crept out into the light, a living skeleton, and totally blind. He was well cared for, and has now quite recovered his health and sight. But his existence was wonderful. He had had no food and no water, and had not gnawed the books or obtained sustenance from any source whatever.—Nature.

"That Washington Letter."—Jersey City Heights. Sept. 1st.—Editor Forest and Stream:—In a late issue of Forest and Stream Mr. Charles Lamman states that a correspondent thanks me for a copy of George Washington's letter in regard to bloodhounds. As a matter of fact, it is the editors of Forest and Stream that state they are abliced to me for the copy, which, by the way, did fact, it is the editors of Forest and Stream that state they are obliged to me for the copy, which, by the way, did not refer to bloodhounds, but to the Irish wolfhounds. I offered it as evidence as to the extinction of the species of dog called frish wolfhound. I copied it from a letter now owned by Mr. John Downs (not Dale, as you have it), of Washington, D. C., and I have the best of reasons for believing it to be an original letter of George Washington. Mr. Lanman says the original came into his possession years ago, but does not state that it never went out of it, which leaves me in doubt as to there being two originals. This I am quite willing to accept, however, for have we not more than one "the only original Jacobs" in New York city?

R. T. Greene.

in New York city?

MONTREAL POULTRY, DOG AND PET STOCK ASSOCIATION, —We have received from Mr. J. H. Cayford, Secretary, Montreal, Canada, the prize list and rules for governing the special exhibition of the above named association which is to be held in Montreal, P. Q., on Sept. 21st, 22d and 23d. All entries must be made at the Exhibition Rooms, No. 235 St. James street, with Mr. W. E. Shaw, on or before Sept. 14th, on proper blanks, which will be furnished upon application. The dogs are divided into fitty-two classes, and the prizes are two dollars and one dollar, for first and second respectively.

NEBRASKA FIELD TRIALS.—As already announced in the Forest and Stream, the Nebraska Field Trials will be run at Millord, eighteen miles west of the city, Sept. 30th, and Oct. 1st and 2d, the arrangements being under the direction of the Millord Sportsmen's Club, Prairie chickens and quail are said to be very plentiful, and no doubt there will be a good attendance and a good time during the trials. This is a good chance for Eastern dog men, to visit their Western consins, and we trust dog men, to visit their Western cousins, and that the trials will be a success in every respect,

—Waterbury, Conn., has been having a dog show of its own, at Messrs Briggs & Highy's drug store. There was but one entry, that of the heautiful litter of puppies be-longing to the head of the firm. It took the first prize.

-Mr. J. H. Harley, Secretary of the Nebraska State Sportsmen's Association, writes us: "I am pleased to say that from indications and inquiries coming in, we anticipate a large attendance at the Nebraska Field Trials, Sept. 30th, and Oct. 1st and 2d. at Milford. Chickens and quail are very abundant in that part of the State."

St. Louis Kennel Club Bench Show.—Mr. Charles incoln, Superintendent of the St. Louis Kennel Club Lincoln, Superintendent of the St. Louis Kennel Club Bench Show, writes us, inclosing copies of letters received to date, from the railroad companies that have consented to carry dogs to and from the show free of charge, when accompanied by their owners or care takers. The following is the list: Pennsylvania Railroad Company, Frank Thomson, General Manager; Wabash, St. Louis and Pacific Railway, H. C. Townsend, General Passenger Agent; Great Western Railway of Canada, W. C. Edgar, General Passenger Agent; Graad Southern Railway, Frank E. Snow, General Passenger and Transportation Agent.

DEATH OF MR. M. VON CULIN.—We regret to be obliged announce the death of Mr. M. Von Culin, well known to to announce the death of Mr. M. Von Culin, well known to the sporting men of this country and in Europe. Mr. Von Culin had been an invalid for at least two years, afflicted with a disease that had baffled the skill of the many physicians who had attended him. His death occurred at his residence in Delaware City, Del., on Thursdny, Aug. 26th. During the greater part of his sickness he was unable to attend to business, which was under the management of his wife, who will continue it, and who asks for the continued patronage of the sporting fraternity.

timed patronage of the sporting fraternity.

—Mr. Vero Shaw's "Illustrated Book of the Dog, Part 13," is before us, and it is one of the best numbers of this famous serial which we have seen. It contains an excellent colored lithograph of two retrievers, one a wavy-coated and the other a curly-coated—the former a lifelike picture of Dusk, the property of Mr. S. E. Shirley, M.P., and the latter is equally good of Tory, Mr. W. A. How's dog. Included in the chapter on fox terriers, their rearing, points, etc., is an explanatory diagram and a table of measurements of some of the best fox terriers of recent times. Chapter 38 is devoted to the harrier, and contains an engraving of Mr. Churchill Langon's typical harrier bitch Countess. The beagle is also reached in this number. Publishers—Cassell, Peter, Galpin & Co., 536 Broadway, New York. 506 Broadway, New York.

A Grateful Canine.—Newburyport, Conn., Aug. 20th.—My master wrote to you to get a prescription for treating a lump on my ankle (knee) joint, which pained mevery much. He followed out your directions, and my paw, thanks to you, I am happy to say is now quite well, and if anything is the matter with me in the future, I shall ask him to write again. I am about four years old, as near as I can remember. Yours indebtedly,

—Mr. H. B. Vondersmith, of Lancaster, Pa., advertises three well-bred dogs for sale. Those in quest of dogs for the coming season would do well to communicate with Mr. V. at once.

MOUNTAIN KENNEL,—We call special attention to the advertisement in another column of three broken dogs for sale by Mr. Chas. F. Kent, proprietor Mountain Kennel, Monticello, Sullivan County, N. Y.

#### KENNEL NOTES.

NAMES CLAIMED .- Lulu-Mr. Waldo A. Howland, of Lowell. NAMES CLAIMED.—Lutt—Mr. Watto A. Howland, of Lowen. Mass., claims the name of Lufu for English hare beagle bitch puppy recently purchased from Mr. Elmore. Grouse—Mr. John A Smethers, of Berwick, Penn., claims the name of Grouse for his Smethers, of Berwick, Penn., claims the name of Grouse for his setter puppy, whelped May 4th, 1880, by T. O'Moore, he by Rory O'Moore out of Neil II., there O'Moore by Rufus out of Stoddard's Friend. Neil II. out of Goldsmith's Neil by Plunket. Grouse was purchased from Dr. M. S. Moore, Fredonia, N. Y. Lady Glen — Dr. H. F. Aten claims the name of Lady Glen for his black and tan bitch puppy whelped March, 1880, by his Glen out of Francis, Flirt. Glen III.—Dr. I. C. Muuroe, Brooklyn, N. Y., claims the name of Glen III. for his black and tan puppy, whelped March, 1880, out of Mr. C. H. Raymond's Juno by Dr. Aten's Glen. Rose and Ruby.—Mr. D. F. Slade, of Franklin, N. Y., claims the names of Rose and Ruby for cooker sample years out of Sennich via Sennich. and Ruby,—Mr. D. F. Slade, of Franklin, N. Y., claims the names of Rose and Ruby for cocker spaniel gyps, out of his Fannie, by Mr. McKoon's Flusher. Bonaparte and Lienau.—Mr. Thomas M Smith, of Jersey, City, N. J., claims the names of Bonaparte and Lienau for his brace of red and white setter dog pups, whelped May 4th, 1880, out of Dr. M. S. Moore's Floss by T. O'Moore, he by May 4th, Is80, out of Dr. M. S. Moore's Ploss by T. O'Moore, he by Rory O'Moore out of Noil II., Rory o'Moore by Burges' Rufus out of Stoddard's Friend; Noll II. out of Goldsmith's Nell by Goldsmith's Plunkett; Floss out of Mr. Asa L. Sherwood's Rusa by his champion France. Nellie.—Mr. B. M. Rommel, of River Edge, Bergen County, N. J., claims the name of Nettie for his red and white setter blich pups, whelped May 4th, Is80, from same stock as Bonapartc and Lienau.

stock as Bonaparte and Lienau.

Sales.—Ruth.—Mr. Charles E. Lowis, of Suspension Bridge, N. Y., has eold to Mr. Robert Walker, of Franklin, Delaware County, N. Y., his cocker spaniel bitch Ruth, out of Fairy by imported Saip. Royal Carle—Mr. James H. Goodell, of New York, has purchased of Mr. Joseph Rosenfeld, of Baltimore, Md., the well-known field trial setter Royal Carle by Carleowiz out of Queen Bess, Royal Carlo received the special award in Class F at the last New York bench show. He was whelped February, 1878. Royz—Mr. Arthur Talbot, Boston, Masa, has bought from Mr. J. N. Dodge, of Detroit, Mich., his prize winner beagle bitch Roxy. Mr. Arthur Talbot, Boston, Masa, withes us that in addition he has purclused a young bitch, six months old, Rattler-Fan, both of which are from Rowett's stock, and that he is expecting three bengles from England the latter part of this month, Net—Mr. E. C. Fowler, of Moodus, Conn., has sold his Righlis hester dog Ned, recently advertised in Forest and Stream, to Mr. M. A. Goodwin, of Honesdale, Py. B. Wells, Je's, Star, to Burgers'

Bred.—Star-Druid.—Mr. W. B. Wells, Jr./s, Star to Burges' Druid. Hornellsville, N. Y., Sept. 6th.—Since Aug. 14th the following bitches bave visited our black stud dog Wildair: Aug. 14th, Holbliches have visited our black stud dog Wildair: Aug. Hth. Hol-list Topsey, chestnut and tan; Aug. 17th, champion Belle, black and tan; Aug. 18th, De Barrie's Fan, liver color; Aug. 23d, Mac-Dougall's champion Cora, liver; Aug. 27th, G. B. Stokes' Midget, liver; Aug. 30th, Fannie (392, F. & S. register), to our liver and white stud dog Roblia Adair. Lady Elgis-Zanzibar.—Mr. H. B. Vondersmiths' (Lancastor, Pa.), Llewellyn setter bitch Lady Elgin-bo his Zunibar, Gladstone-Mersey. Luta-Zanzibar.—Mr. H. B Vondersmith's lemon and white Llewellyn bitch Lulu, to Zanzibur. Lill II.-Tom.-Mr. H. B. Vonders Lill II., to his Gordon setter Tom.

DEATHS.—Bess-Tom, whelps.—Mr. H. B. Vondersmith's Gordon setter Bess whelped Aug. 18th, 1850, ten puppies, eight dogs and two bitches, by Tom. All the puppies have since died.

#### RANGE AND GALLERY.

TORONTO, Ontario.—At the annual meeting of the Ontario Riffe Association, held during the prize meeting, Col. Gzowski said he had watched the association carefully, and found that it had improved in everything—finances, shooting and membership. He would like to say a few words respecting the rifle shooting of the would have to say a few words respecting the rile shooting of the country. There was no doubt that Ontario was the leading Prov-ince, and he was glad to see it was — He did not wish to bring Do-minion affairs before them, but he must allude to the last Wimble. don team. They had not been as fortunate this year as usual, and this was owing a good deal to the weather, for the men had begun this was owing a good deat to the weather, for the finel had begin well, but, toward, the conclusion they had had to shoot when they could scarcely see the targets. Another thing he thought was that they had been overcoached, and he intended at the meeting of the Dominion Association to bring before the council the mat to the Dominion Association to rung before the control the mat-ter. He thought too much coaching was a mistake. In his idea the Wimbledon team did not visit England to show what fine shots they were, but to help and strengthen the tie that bound Canadato the Mother Country. He did not believe in all the setcannanto me some Country. To our not netice in an the set-entillic adjuncts used in shooting, such as wind gauges, etc., but thought the men should fire under the same conditions as in the presence of an enemy. Acting on this principle he intended of-fering a prize of \$100 mext year, to be shot for under these condi-tions, and as he was going to Brighard in October he would bring the matter before the National Rifle Association, and endeavor to save the Kolapore cup shot for with the usual military weapon without artistic sights.

Lieut.-Col. Gilmour, the President, thanked Lieut.-Col. Gzowski.

Licut-Col. Glimoir, the receivent, transcent accent col. vzzwsat. He purposed presenting to the association the sum of \$500 to be laid out as the council might thick it.
Licut-Cols, Gzowski, Walker and Otter; Majors McDonald and McPherson, Capt. Mason and Licut. Mac Nachtan were chosen representatives to the Dominion Association.
Major McPherson, Guards; Capt. Mason, Eighteenth Battalion, and Licut. Cent. Engineers, were anumpined a committee to see

and Lieut. Cruit, Engineers, were appointed a committee to se lect a team to represent Ontario at the Dominion Rifle Associa

lect a team to represent Ontario at the Dominion Hille Association's meeting at Ottawa. At a subsequent meeting of the council Lieut.-Col. Gilmour was chosen President, the list of officers being completed as follows: Vice-Presidents, First Military District, Lieut.-Col. Walker, Seventh Fusileers, London; Second Military District, Lieut.-Col. Walker, Seventh Fusileers, London; Second Military District, Lieut.-Col. Worsley, Brigade Major, Kingston; Fourth Military District, Lieut.-Col. Magen; District Paymaster, Toronto; Secretary, Lieut.-Col. Alger, District Paymaster, Toronto; Secretary, Lieut.-Col. Otter, Queen's Own Rifles, Toronto; Auditors, Lieut.-Col. Arthurs, Queen's Own Rifles, Toronto; Capt. Grabam, Reserve Militia, Toronto.

BALTEMORE, Aug. 30th.—The match between the Columbia Rille Association and the Maryland Rifle Club resulted in a defeat for the latter at both ranges. The 200 yard match was shot at 2 o'clock, and the scores made are appended. Mr. Roeder, of whom the defeated club expected a good score, very much disappointed by a poor 38, but, owing to a bad cold, he was not in condition to shoot well:— COLUMBIA RIFLE CLUB.

Chambers. H Laird F. J. Lauritzen . . J. O. P. Burnside. 

At 600 yards Mr. Lynch was very unfortunate in his gun lead-ing so badly at the sixth shot as to cause a miss, and necessitated his using another gun for the balance of the match. The scores are:-

#### SCHUETZEN CORP NOTES.

NEW JERSEY SCHUETZEN CORPS.-Hoboken, N. J., Sent. 2d.-At. NEW JERSTY SCHUETZEN CHRIS.—Homoto, A. J., Sept. 21.—At the regular meeting of the Jersey Schuetzen Corps, A. Harde-kopf, Captain, held at the headquarters of the corps, 80 Hudson street, Hoboken, Sept. ist., a full report was read from the comstreet, Hoboken, Sept. Ist., a full report was read from the committee of the water excursion, which was held on June 20th, and showed a net profit of \$45 to the benefit of the treasurer. The committee of the shooting festival, which was held Aug. 5th, at the Schuetzen Park, Union Hill, reported progress. Other regular business was transacted. A large and interesting needing is expected on Wednesday, Oct. 6th, as this is the annual meeting for the election of officers. The above named corps holds meetings the first Wednesday, of each month.

BOSTON, Mass., Sept. 4th .- At Walnut Hill, to-day, the usual connections at the short range took place. The attendance was small, owing, probably, to the intends heat, the thermometer at the shorting parilion standing at 100 degs. The day, with this exception, was an excellent one for shooting, the wind blowing very gently from 7 o'clock and the light giving but little trouble. Excellent records were made. Mr. Jewell's score of 113 on the Massachusetts target has never been equalled. MASSACHUSETTS MATCH.

New York Schuetzen Corps.-The regular monthly meeting Sixy Tonk Scatterizes Codes.—The regular monthly needing of the New York Schuerzen Corps was held at their rooms, 85 Forsyth street, on Thursday evening, Sept. 20, Major George Acry in the chair. More than 100 members were pursent. The details of the promosed trip of the corps to Shrewsbury were discussed, and some regular business followed.

A badge was offerd by a representative of FOREST AND STREAM to be shot for at the coming meeting, by members that had

won a prize.

The excursion to Shrew-bury on the 14th and 15th insts, promises to be largely attended and to be in all respects a success.

ises to be largely attended and to be in all respects a success.

Remens Flowy Sign,—Comp on Surface Creck, Colorado, Aug.

17th.—Editor Forest and Stream:—Thanks to Mr. Van Dyke for bits able article on gun signist. I have derived a great deal of useful information from bis articles in your columns. If I am not seking too much I would like to give my experience with front sights. Through accident I discovered an article fur a front sight. sights. Through accident I discovered an article for a front sight that answers the purpose so well that can 'the leg isting it to such of your readers as are troubled with bright sights. I carry a Horchkits repeating rifle (sporting), that all know that have ever seen it has the sume "melon silee" that Van Dyke speaks of for a front sight, and the glisten of it has bothered me a great deal and caused me to miss some splendid shots. Mr. Van Dyke came to the rescue, and I changed mine accordingly. It was a wast improvement, but, I am sorty to say, did not answer for a cavalryman, who has to carry his gun on a sling belt, hanging down the start side in horse. right side of his horse, the muzzle near the ground; that it former much of a hook, to catch in the brush and weeds, and finally I too much of a mook, to caten in the brush and weeds, and many I had it pulled out and lost. So I set my wits to work to find the necessary material to make another one. In searching my saddle bags I came across an old piece of a rubber gutta-percha comb. bags I come across an old piece of a rubber gutta-percha comb, which, being just the rist thickness, I soon had it fitted and shaped. I made it the same old "melon silee," to allow it to silde past anything that it might come in contact with. I have given it trels in all kinds of weather. In cloudy weather, in sighting over the sight, the front sight is of a silvery gray, and when the min as shinds brightly it looks jet black. It is just what is desired for a front sight. Hoping that some of your numerous readers may give it a trial, I am yours,

COMPANY K.,

Fourth U. S. Cavalry.

any greet in trial, I am yours,

A Phorpsstoval's Views.—"Swivester Enisht," asys the Crarling Enterprise, of Virginia City, Nev., "keeps the shooting palery, and he feels greatly aggreeved at the kind of shooting palery, and he feels greatly aggreeved at the kind of shooting participations of the property appreciating and patronzing his establishment. "Here I am, says Knight, "with every convenience at hand, ready to so train the people that they will be able too kill man at very shot, and indood comes to account to the property appreciating and patronzing his establishment. PRIVATE PRACTICE CLUB.

ANNUAL REPORT FOR THE SEASON ENDING JUNE 30TH.

(Concluded from page 94.)

Concluded by the proper state of the cutter and the been given. Most of the prize winners were present, and, in view of the fact that no cash prizes would be given in the future, it was agreed that the rule of awarding hours only, should take effect at once. However, as some of the prize winners were not present, and as the officers do not regard it as necessarily binding. non them to enforce this rule against members not present, they will promptly forward to any prize winner the prize to which he is entitled, upon being notified by bim. Otherwise, the member will be deemed to have acquiesced in the action of the club. In order

that members and interested archers may know the manne in which bonors are taken, the Secretary deems it proper to pre-cede the list of winners with a portion of the section of the Con-stitution, fixing the different excellencies for which honors are

the member making the highest average in his class, at the

"To the member making the highest average in his cuss, at the single York Round—First Honor.
"To the member making the highest individual score in his class, at the single York Round—Second Honor.
"To the member making the highest average score in his class, at the life yards range—Third Honor.
"To the member making the highest average score in his class, at the life yards range—Third Honor.

at the 80 yards range—Fourth Honor.

"To the member making the highest average score in his class, at the 80 yards range—Fifth Honor.

"Provided: That no member shall receive more than one award

Thus it will be perceived that honors are graded in such a man Interest with 66 perceived that nonors are grained in state a man-ner, that if one member should obtain the superiority in his class at all the ranges, and should also score the highest single York, yet he would only obtain the award for best average York Round, and the member making the best single Round would be awarded the bonor of "best individual York Round," and so through all the grades. Under the operation of this rule, the following is a list of the winners of honors in each class:

ı	Second Honor, Maurice Thompson, best York Round	449
	Third Honor, Lorenzo Devol, average 100 yards	103
	Fourth Honor, Edwin Devol, average 80 yards	94
	Fifth Honor, Tac Hussey, average 60 yards	90
ı	OLASS II.	
	First Honor, L. L. Peddinghaus, average York Round	35.4
ı	Second Honor, F. H. Walworth, best York Round	329
	Third Honor, P. S. De Graff, average 100 yards	62
ı	Fourth Honor, C. G. Slack, average 50 yards	21
ı	Fourth Honor, C. G. Slack, average 50 yards. Fifth Honor, E. T. Church, average 60 yards.	72
	CLASS III.	
	First Honor, Jesse B. Devol, average York Round	252
	Second Honor, C. G. Hammond, best York Round	398
	Third House Edward D Walls arrange 100 rowds	
	Third Honor, Edward F. Wells, average 100 yards. Fourth Honor, C. C. Moore, average S) yards.	50
	Fifth Honor, W. Holberton, average 60 yards.	55
	Fitth Honor, w. nonverton, average to yards	-01

The Secretary has omitted the fractional parts of a point upor the total average of each member, though, in arriving at that total, he was careful to use the fractions in each monthly report. total, he was careful to use the fractions in each monthly report. In the award for the average at 80 yards in first class, the nearest approach to a tie was found, Mr. Edwin Devol and Mr. Tac Hussey having each an average of 91 points, with the fraction very slightly in favor of Mr. Devol.

The season's record of the club exhibits some very line performances at each of the ranges, and at the whole Round.

The best individual York Round was scored by Mr. Will H. Thomston, Aralista are followers.

Thompson, April 5th, as follows:-

giving a double Round of 212 1,029.

The nearest approach to this, by another archer, was the fine score of Mr. L. L. Peddinghaus, on April 28th, as follows:—

100 Yards. 80 Yards. 00 Yards. Total.

441-175 40-178 24-129 198-476 198-476

Preceded on April 24th and 27th with one of 41-155 39-137 giving a double Round of 211-833. 23 -- 125 103--415

giving a double fround of 211- 883.

Mr. Maurice Thompson came we'll up with a fine double Hound shot, on the 19th and 39th of April, as follows:

107 Yards. 80 Yards. 19 Yards

Total ... ... 65-240 83-401 44-234 183-875
The 80 yards shooting in this double round was the highest record obtained by any member of the club with two consecutive scores. At the 10 yards range prominence was taken by the record made by Mr. Will H. Thompson April 5th, 45-202, the greatest number of hits being 49, score 183, by the same archer, Mr. Peddinghaus' record of 44-175 coming well up. At the 80 yards range the scores of 41-274, 44-294, 41-295, 39,197, 41,197, 40-128, 24-192, 40-718, by Mr. Will H. Thompson; those of 39-201, 41-199, 40-181, by Mr. Peddinghaus, and those of 41-203, 42-198, and 37-181, by Mr. Maurice Thompson, may be considered performances of great excellence, while many other members recorded scores of scarcely less merit. The leading score at 60 yards was achieved by Mr. Maurice Thompson on the 9th day of March, he scoring 24 bits and 175 score, a record of such surpassing excellence as 44-::34 66-240 83-401 by Mr. Maurice Thompson on the 9th day of March, he scoring 24 hits and 176 score, a record of such surpassing excellence as likely to remain for some time as the "best performance" at that range in American archery. The nearest approaches to this great score were the records of 22-158 and 24-154, by the same archer; those of 23-145, 23-144, by Mr. Peddinghaus, and that of Mr. Lo-renzo Devol, of 24-133. Many other members approached 40 points at this range, and altogether the 60 yards work was of a very high character. verv bigh character.

It may be that three golds have been made at an end by several It may be that three golds have been made at an end by several members who have not reported the fear, as there existed no rule requiring such report. However, several such performances have been reported, as follows: Three golds at an end at 80 yards—twice by Mr. L. Devol, once by Mr. Tac Hussey, and once by Mr. L. L. Peddinghaus, while Mr. Maurice Thompson obtained four consecutive golds at this rance, but did not get three at an end. Mr. Lorenzo Devol obtained three golds at an end twice in the same 48 arrows—a rare feat indeed. At My yards Mr. E. T. Church obtained three golds once, Mr. Peddinghaus once. Mr. Will H. Thompson four times, and doubtless several other members achieved the feat without making a report of it. Almost without exception the members have adopted Ford's system of aiming, with only slight modifications in individual

instances, and while the change has necessarily cut down the

instances, and while the change has necessarily cut down the scoring for a time, the general improvement is inevitable.

In closing the report the Secretary and Treasurer begs leave to submit a brief statement of the receipts and disbursements of the club up to the 1st day of July, 1889, and in doing so calls the attention of such members of the club as have not remitted the attention of such members of the club as have not remitted the stention of such memores of the club as have not remitted the additional one dollar required of them by the late amendment of the constitution. Further, the Secretary informs members that the constitution and rules, as amended, have been printed in pumphlet form, and will be at once distributed to the members, and such other archers as may desire to become members:—

With sincere thanks to the members, who have by their many

With sincere thanks to the members, who have by their many kind letters encouraged the Secretary in his labors, he wishes each and every one far greater success in the second season of the club than greeted him in the first.

The Private Practice Club is now well started upon its second season. Its strength in its infancy indicates a lusty menhood and great longerity. The Secretary nurses in his heart the wish and hope that he may have such pleasant meetings in coming years with the members of the club as he enjoyed at Buffalo, and again and again enjoy their triumphs as he there did, before any one of them is called to them is called to-

"Lay the strong bow and arrows down,

Mellow with age, and in renown."
WILL H. THOMPSON, Secretary and Treasurer P. P. C.

ARCHERY TOURNAMENT .- To be held on the fair grounds of the ARLABRI MODRAMAN,—10 ob Bend on the latt grounds of the New Jersey State Agricultural Society during the Twenty-second Annual Pair at Waverly, between Newark and Elizabeth, N.J., on Wednesday, Sept. 24, at 10:30 A.M. and 2 P.M. Waverly is on line of Pennsylvania R. R., Elizabeth Horse R. R., and New Jersey Central R. R.

ersey Central A. R. Wednesday, Sept. 22d, at 10 o'clock A.M.—Ladies; 48 arrows at weomessay, sept. 22d, at 10 o Clock A.M.—Lagics; 48 arrows at 40 yards. POOR CHICKET!—"Say, Bill, do you call this 'ere a cricket ground? Why, it looks more like a fish pound at hebb-tide, nor a bit to play at cricket." Thus speke a man of simple mind to a comrade, while through the air we seemed to hear sweet strains bit to play at cricket." Thus spoke a man of simple mind to a comrade, while through the air wo scemed to hear sweet atrains of music. The instruments seemed familiar, yet it was not the music of the vina, the kine, the crowth, the acolian harp or the banjo. We listened in beatifue wonderment until the end—and the game of lawn tennis was done. Thank heaven that there is no graceful writer like Miss Miftord alive now, to sing the praise of toy balls and catgut. For when the fervent authoress of "Our Village" wrote about "the manly game of cricket," she only spoke of the delightful and delighting power possessed by "a little bit of leather and two pieces of wood," The village green other time was not prostituted to childish games; no guady! effeminate males, adorned like embrediered tobacco pouches, the time of the control of the contro showers," the turf that was laid out for a special purpose, de voted exclusively to another. We have not for years worked hard to advance the interests of cricket, to now allow an inno-vation like lawn tennis to crowd out our manly game without a word of protest. Lawn tennis is a delightful game for women and children, and, perhaps, for those of our own sex who are of feeble body and mind; but this is no argument why a cricket feeble body and mind; but this is no argument why a cricket ground should be converted into a nursery or an infirmary. Should the shade of the man who received the "hover from Jackson" look down on some of our cricket fields of to-day, he would no doubt think that he was money in pocket that he was dead—and he would be about right. Yet we love to see children eajor themselves in the open air—particularly after a wet day in the house. We have a boy. It delights us to see him squirt a hose, of which pursuit he is extremely fond. We have also a girl. It soothes us to see her make a mud pie; but should the pie be erected on our favorite pitch, or the hose-squirter direct his aim at the back of our neck, we would object.

Squitter uncer his and hard feet, get, get, get, shell the stumps that are now firmly planted be torn up before they have taken root? Not if we can help in staying the

COUNTY CRICKET.-Brooklyn, N. Y., Aug. 30th.-Editor Forest COUNTY CAIGNET.—Brooklyn, N. J., Aug. 39th.—Editor Forest and Stream.—In answer to your request for information as to the formation of a Kings County eleven, I would state that earlier in the season I took considerable trouble to ascertain how such a project would be supported by resident cricketers of Kinss County, and I am glad to say that my efforts met with considerable success. I nam satisfied that a good team could be got together if any other county will do likewise, and thus make an opportunity for a county match. The object of the organization was simply to play matches with other counties or localities, so as to bring cricketers on the field in different comminations—playing axiants bowlets other than we are now in the habit of doingagainst bowlers other than we are now in the habit of doing-thus helping to make more proficient cricketers. Such matches, I have no doubt, would be of great advantage to cricket. I hope you will stir up the cricketers to organize other county teams. and, if possible, play at least one match this season, JOHN FILMER.

JOHN FILMER.

UNITED STATES 1%. CANADA.—On Sept. 3d the Executive Committee of the Cricketers' Association of the United States met and selected the following team to represent the United States: Messrs. George M., Charles, Daniel S. and Robert Newhall, Van Rensellaer and Clark, of the Young America C. C., of Philadelphia; Brewster, of the Germantown C. C.; Thuyer and Law, of the Merion C. C., of Philadelphia, and Kessler, of the Staten Island C. C., of this city. While it is unobabelly the strongest feam ever selected to do battle for the United States, we regret that it is not thoroughly American. In times gone by the United States eleven was composed of residents of the United States, irrespective of their nationality. But now that the American exponents of the was composed of resources of the Chiled States, irrespective of their nationality. But now that the American exponents of the game have reached a degree of perfection equal, if not superior, to that of the foreign cricketing element, we regret that a new departure was not made from the old-time custom, and none but departure was not made from the old-time custom, and none but Americans selected to represent this country. As it now stands, it is a mixed team. It is not, however, too late to change, and we trust to see none but Americans take the field on Monday next. We cannot, however, but congratulate the committee for the tact they have shown in their selection, which has made everything work so smoothly. The system of choice has been an excellent one, and if the United States eleven does not win it will

cellent one, and if the United States eleven does not win it will not be because it was handleapped by internal diseasions or unmanly jeatousies.

From Canada we do not receive the same good accounts; in fact, we hear of one club that already talks of withdrawing from the association on account of its not being asked to send a representative to play in the trial match, West zs. East. As this neglect occurred in the face of that club's winning two association ties, we admit it has grounds for complaint, butfor the good of cricket we urge it not to act too hastily. There is no reason why the Ontario Association should not work as harmoniously as the one in the States. The Governor General has recently accepted the office of President, and it will be an everlasting reproach to the cricketers of Canada if the association does not send a representative eleven to meet their American cousins. The match. the criticates of changian it is association counties. The match, easi far use their American counties. The match, easi far as its wifest, which was played Sept. Ist at Toronto, was a failure as far as its object in bringing together the best players of the Dominion was concerned, neither Hamilton, Ottaw or Montreal being represented. The following is the score:

GERMANTOWN JUNIORS US. STATEN ISLAND JUNIORS.-This GERMANTOWN JUNIORS CS. STATEN ISLAND JUNIORS.—This match was the Burs in the annuals of American cricket, where a team of boys have left their home to play in another city. In bygone days it was considered the thing to revolve as much as possible and secure players fresh from the other side to fill the ranks of the clubs' elevens. A few organizations continue to advocate this suicidal system—the result in the long run is lamentable fall-ure. The clubs that will be found in the future foremost in the race are those that have to-day established training schools, namely, junior membership elevens. Instil young blood in your clubs and teach the youngsters how to play the game, and, moreover, in a gentlemanly way, and it will not be long before the question will arise's who shall not play? "rather than "who can we find to fill up our elevens." Mr. Thos. McKenn, the President of the G. C. C., came over to look after the boys, and Mr. F. W. Bissell, the Secretary, was on hand to score. In a conversation on ind to hit up our elevens?" Mr. Inos. Mokean, the President of the G. C. C., came over to look after the boys, and Mr. F. W. Bissell, the Secretary, was on hand to score. In a conversation on the subject of junior membership, Mr. McKean stated that his club had recently been obliged to pass a law limiting the number of junior members to 100, that the club was in receipt of many new applications, and the junior list was now upwards of ninety names. The neven was composed of the sons of many of Philadelphia's oldest cricketers: such names as Wister, Morgan, Welsh and McKean having been household words in cricketing circles for many years. The first two refreshed our memory of the past and brought back incidents of the cricket field long forgotten. These Philadelphia boys, too, have a mighty good notion of the game, and many of their remarks upon the play were pat. Both learns were composed of little gentlemen, and the play from first to last full of "pretty cricket:" may they keep it up for years to come. Almont the chips of the old block were Mr. Haughton's two sons, who have been playing the game at Lenoxville, Canada-We take pleasure in giving space for full score:—

"The Australians have at last, chiefly through the help of Lord Harris, been able to arrange a match with the best English eleven. The match was begun on the Oval on Monday last, the following team playing for England: W. G., E. M. and G. F. Grace, Hon. A. Lyttleton, Steel, Penn, Lucas, Shaw, Morley and Barnes. England went first to the bat, and at the end of the first day's play 8 wickets were down for 410 runs, of which W. G. Grace contributed 15° P. M. Grace 30.

Wide, L. Haughton, 1. Umpires—Germantown, Brombead: Staten Island, Lane.

On Tuesday the match was resumed, and the Oval is said to

or Tuesday the match was resumed, and the Oval is said to have never presented such a spectacle. Over 20,000 people witnessed the game the first day, and about 20,000 the second day. England's innings closed for 420. Australians' second, having been obliged to repeat, 6 wickets were down for 170; Murdock 78, and McDonnell 33. Unfortunately Spofforth, the demon bowler, who was injured, did not play. As were to present the Australians are 101 behind to save a one innings defeat. Full score will be published later on.

NEW YORK ENGLISH TEAM IS. SCOTCH WANDERERS.—There was but a small attendance at Prospect Park on Monday last to writness the interesting match between the teams composed of the first the subject of the Manhattan Cricket Club, who kindly offered their ground for the occasion. Shortly before non the Scotchmen put in an appearance, headed by Bowman, the piper of the Caledonian Club, whose dulect strains and appropriate selection of tunes during the different phases of the game was had under the auspices of the Manhattan Cricket Club, who kindly offered their ground for the occasion. Shortly before non the Scotchmen put in an appearance, headed by Bowman, the piper of the Caledonian Club, whose dulect strains and appropriate selection of tunes during the different phases of the game appearently caused great satisfaction to those from the land of the thistle. At 12:230 P.M. the play began on a rather bitting wicker, and though the day remained cloudy the light was excellent up to the time for drawing the sumpast 623 P.M. The Englishmen went first to the bat, and secured the good total of 127 in their innings, nearly one-half of which being contributed by Norley, the M. C. C. professional. His score of 01, not out, was a remarkable was a first of the carried of the carr

led off excellently, 22 runs being up before the fall of the first wicket, but after the first three bats had been disposed of the remaining ones added but little to the total. This was due to the excellent bowling and fielding of Filmer, whose style was favored by the wicket. He also made three rattling catches. During this innings Norley, who had been allowed to play as a substitute, was put on to bowl, and very properly objected to by Mr. Lendrum, the captain of the Scotch team. This disturbed Mr. Jackson's equanimity so much that he left the ground in a child-h pet, and his action was severely criticised by all present. Until a man learns to control his temper a cricket ground is no place for him. Hamilton bowled splendidly in the second innings. Score:—

First prize, gold mean; second prize, rickelphated beat-hook, preprize, gold medal; second prize, nickelphated beat-hook, presented by Mr. W. P. Stevens, of Rahway, N. J. Hith-Upset race; distance one quarter of a mile. Prize, gold model.

Fith—Upset race; distance one quarter of a mile. PTRO, good medal.

The first race will be called at 2 p. a., sharp; second at 2:39 r. s. The first and fourth will be started together at 3 p. a., and place the first properties of a p. a., and place the first properties of the properties of the first properties of the

New York Canor Clun.—The regular of Sept. 4th, at Ne Brighton, included 8 races, a paddling, salling and upset race. Three was won by Mr. C. K. Monroe, the skiling race by the bit Mr. C. Yann, the course being 3 unies and the time 39m, 53s. I the upset match Mr. C. P. Sievens was accessful.

#### MERITS OF THE CANVAS CANOE.

MERITS OF THE CANVAS CANOE.

Billor Forest and Stream:—
Though you have not by any means ignored the canvas came in your colutions, yet I don't think it has received the notice us merits warrant, and, like many another good thing, has suffered by having prorify executed societies pub before the public. It is attached to some of the execution of the public of the having provided the public of the hard the public of the hard 
sording to style and finish, and these, I think, are not high figures when compared with the cost of a good wooden cannot.

We believe Mr. Rushton has succeeded in building the lightest ance on record-total weight, is pounds-from which we judge that on the question of weight there need be no material differ once between canvas and wood. Our correspondent has over-looked the liability of canvas to cutting and ripping on sharp rocks. With the revival of canoeing there will be many im-provements made in a few years, so that it is hard to decide in nooked the mannity of carries to cutting and ripping of smarp rocks. With the revival of canoeing there will be many im-provements made in a few years, so that it is hard to decide in favor of any one kind as yet. Possibly both canvas and wood will flourish side by side.

w. H. H., bast clambridge.—Prease inform the fit there is a law in the State of Maine probibiliting the shooting of partridge from 1889 to 1881? Ans. No; but there is a law prohibiting the killing of quali before Sept. 1st, 1883.

M. D. C., Asbury Park.—Tey for worms, areca nut, two grains for each pound weight of dog, administered after dog has fasted twenty-four hours, follow with castor oil. Give later on two grains of quinine three times a day and feed on good stimulating

food.

G. W. S.—Much the best way to start yachts in a race is to give them a genuine "flying start" to a single gun, and not allow ten or lifteen minutes to cross the line in, unless you are sending off so many boats as to make fouling a certainty. With this latter method the start is robbed of all skill and maneuvering, and be

omes featureless.
H. H., New York.—If a man buys quail, puts them on his farm and lets them breed, can be shoot them out of season? Ans. If he keeps them onlined, he can no doubt kill them at any time, just as he can his chickens; but if they are allowed to go at large, we do not think that he would be permitted to shoot them. Certainly he ought not to do so.

()LD SUBSCRIBER, Harrisburg, Pa.—The bird which you send is Macrothamphus grissus, known to shore gunners as dowitch, brown-back, gray-back, etc. An abundant shore birdalong the New England coast. It occurs in large Bocks during the spring and late summer, and affords good sport over stools. See articles

and late stillmer, also alloyed good sport over stools. See articles on buy subpershooting, now appearing in Forest AND STREAM.

G. S., New York.—I. How far out on Long Island would I have togo to find good woodcock shooting; also qualit, when in season?

2. What kind of shooting would I find around Kingston, N.

J. Aus. I. There are some woodcock about Islip and Sayville; and in the season excellent quali shooting near East Hampton.

A home Kingston will be found out of the control of the contro 2. About Kingston will be found quall, a few woodcock and some ruffed grouse

ruifed grouse. Fetter, Washington, D. C.—Rub well the part affected, twice a a day, with the following ointment: Powdered bicarbonate of repotats, one ounce; powdered white vitrol, one-quarter ounce; sub-sulphur, two ounces; lard, eight ounces. Feed no meat. Give three drops of Fowler's Solution of Arsenic twice a day in food. Persevere with this treatment and it will produce the food. Persevere with this treatment and it win produce in right result.

B. Concord, N. H. For worms, fast the dog for eighteen hours and ordered area nut, two grains for every pound

and give freshly powdered area nut, two grains for every pound of dor; to be followed six hours later by castor oil. We would suggest that you try same ointment as recommended to flirt in this column. (live no meat, and administer two drops of Fowler' Solution of Arsenic twice a day for food. Keep kennel and bed-

DALE HIGHLAND.—Can you give me the pedigree of Mr. James DALE HIGHLAND.—Can you give me the pedigree, of Mr. James Gordon Bennett's dog, Don, now dead? I have been informed that Dan was imported by Judge Hedford and sold to Mr. B. for \$2,009. Ans. Mr. Bennett's dog Don was purchased for him in England, but no proper pedigree was ever secured. He belonged to the jot blacks of Lord Ossulston's, now Earl of Tunkerville's breed, Chillingham Castle, Wooler, Northumberland.

breed, Chillingham Castle, Wooler, Northumberland.
C. C., Mochester, N. Y.—My black and tan, of the smallest kind, and now about ten weeks old, has had two very violent fits, frothing at the mouth, with violent convulsions. Is this asymptom of worms, or may it be the first stage of distemper? What can be done for him? Hefore he had the last fit he lay very drowsy and quiot. I have been feeding him with meat. What shall I do for timet. I have ocean recoming him with meat, what shall I do for him? Ans, Give no meat for a few weeks. Give a few doses of sulphur, and then a dose of castor oil. J. J. J., Winchester, Va. –Please give me a recipe for glue to be used in making split bamboo rods and the kind of cane used, price,

used in making spit oamoor odds and the kind of cane used, price, etc. Ans. The best white glue is used, "bone glue" as if is called. Norris used "Hilton's glue and cement," and found it good. The new lish glue, made of fish skins, by the filte and Isinglass Company, of Gloucester, Mass, might be good, as it is one of the strongest glues we know of. Get the best Malacca cane; the

trongest gives we know of. Get the best Malacca cane; the rice can be obtained from dealers.

E. W. K.—For housing topmast, make the mast rope fast at one de of upper cap, reeve down through a sheeve or dumb sheeve page 1. n heel of topmast, then up through block on opposite side of cap and the end down on deck. Hang by this mast rope in small boat. In larger one use a "bale sling" bill way up mast head, or an ordinary lid to cockbill by a tripping line. See Kennj's "Yazah und Boat Sailing," or examine yachts in commission. Have stays and shrouds so that they can be "come up" with and set up again readily.

again readily.

PHILADELPHIA.—Eleven sloops and two cutters started from
Glen Cove for New London on the N. Y. Y. C. cruise. If the cutters are included among the sloops, as they often are, the twelve startiers stipulated for in the betwock part in the run. In that case B wins, as Mischief was first boat to anchor in New London in her class. She was beaten by Regina only, but Regina belonzs to the second class sloops. Mischief beat Gracie, the second boat of her class, on chapsed time as well as on actual time, without he time allowance due her.

M. M. M., Ohio.—My pug bitch puppy, five months old, has had two severe fits recently. She would commence running, all at once fall in a fit, yell terribly and froth at the mouth. In about once faint a at, yet termby and foth at the mount in mount to motion the normal record to the first set of t dog will probably come round all right.

Of win probably come round an right.

C.T. L., Fryeburg, Maine.—A puzzle-peg consists of a strong vood, such as ash or oak, attached to the neck by a leather collar, and to the jaw by a string tied just behind the tusks or canine teeth, so as to constitute a firm projection in continuation of the

and to the jaw by a string ited just beamed the tusks or camine teeth, so as to constitute a firm projection in continuation of the lower jaw; and, as it extends from six to nine inches beyond it, the dog cannot put his nose nearer to the ground than that amount of projection will allow of. The young dog should be well accustomed to it in the kennel and in the tield, before he is hunted in it. This, and working a dog on overflowed meadows, may in time accustom him to work with his head up. Teaching him to retrieve from or find his food on high places will, of course, assist in teaching him to feel for the seen it nhe air. H. M. T., Ogdensburg, N. Y.—My red I rish setter pup, eight months old, is very weak on his legs and across his back, having scarcely any inuscular control of himself, as if paralyzed. It is most apparent in his rear, his hind legs giving way under him when standing quiet, and when he attempts to run he falls down and rolls over. He has always seemed in health otherwise; is playful and full of high spirits, and, to my knowledge, has never been hurt. Any exertion renders him worse. Ans. Your puppy has chorea; of course, we cannot, from your description, give the cause. Treat him with notes, such as quintine and nax vomica, and twice a week give a little sutphur. Counter fritation

has chorea; of course, we cannot, from your description, give the cause. Treat him with tonics, such as quinine and nux vonica, and twice a week give a little sulphur. Counter irritation along the spino is also sometimes serviceable.

Translo.—My softer puppy bas been afflicted with a disease that I do not understand. Two weeks agoslie had a large bunch stather on her neck, which broke and discharged for ten days. Other sores have broken out, and are still discharging; in the mean time she has grown so weak as to be unable to stand. She had spasma and fits for two days, but somehow seems to live. The stench from the sores is almost unbearable. Three other puppies from the same litter, I have learned, are afflicted the same way. One has died and the other two are expected to die. What is the One has died and the other two are expected to die. What is the cause? Ans. Probably due to septikeemia, or blood poisoning, but the description you give is not sufficient for us to determine the character of the "sores," which are probably abscesses. Write more fully and we will advise treatment.

J., Baltimore, Md.—I have two pug pupples now in their sixth month, one of which, the bitch, is very nervous and exentable, and the other is generally the reverse of this. Recently the bitch had three fits—I call them this for want of a better name—and the dog has had one. The fits are caused by a sudden opening or clost leaves the sudden opening opening opening or clost leaves the sudden opening opening opening or clost leaves the sudden opening openin ing of doors; strange noises, as whistling, rapping on the gate

etc. The fit consists in persistent running and barking, a dispo The declarace in persistent tunning and bottom, it is upposed to the following the term of the following the follo developed nervous system, possibly from too close in-breeding Plenty of exercise in the open air in cases such as you describe, where the feeding is proper, is the best remedy.

where the feeding is proper, is the best remedy.

A. W. E., San Francisco, Cal.—1. Does the cutting off of the last Joint or Joints of a dog's tail prevent distemper or other discusses?

2. What age should it be done? 3. What age must a puppy be before I should train him? 4. Why are double nose dogs considered better than single nose dogs? Ans. 1. No: although there is a superstitious belief to that effect. 2. Docking a dog's tail should be done after weaning. We don't believe in it. 3. A puppy should always be taught not to disobey. When he iss's to eight months old you can house-break him, and two months later field-break him. See articles recently published on "Dog Breaking" in FOREST AND STUKAM. They will give you the points. 4. Double nose dogs are not considered better than one that is without one. The noses of double nose dogs are apt to become sore, as the dry grass is liable to draw through the division come sore, as the dry grass is liable to draw through the division and cut them

G. C. W., Canada, - On a certain cricket ground there is a tres quite near the crease. The umpire said that a ball was not dead until it touched the ground. I say it is dead if it touches the tree, Who is right? Ans. A ball caught from a tree, or glancing from a wall, or rebounding from a fence, a tent or anything that is above ground, can be legally crught, it would be better, however to have a local regulation against such catches, the striker being allowed so many runs instead, for in very few cases would such a cutch have been made legitimately had the obstruction not facili-This is only one of the absurdities of the laws of cricket.

tated it. This is only one of the absurdities of the laws of cricket. F. W. M., Summit, N. J.-I purchased a gun about four years ago stamped "Walter Scott" (breech-loader). Has it any connection with the W. &C. Scott? What do you think of the same? In loading shells with Curis & Harvey's English sporting pow-In loading shells with Cur'ss & Harvey's English sporting pow-der, is the same quantity used as American powder? and what number is proper to use for ordinary shooting? Ans. 1. The gun you mention is not the same as W. & C. Scott. It is probably a cheap English gun, but may be good. 2. Use less Curt's & Harvey —how much less depends on the size of the gun, If 10 or 12, half a drachm. For a breech-loader use a large size of powder.

ATHLETE, Pittsburg, Pa.—The fifth annual meeting of the National Amateur Athletic Association will be held at Mott Haven Sept 25th. The best smatteur records in England, at American championship zames, to Aug. 1st, 1889, are as follows: 109 yards run, 101-5 sec., W. P. Phillips, London A. C., July 3d, '0; 200 yards run, 22-5 sec., W. P. Phillips, London A. C., Sept. 28th, '81; 440 yards run, 52-5 sec., J. Shearman, London A. C., June 7th, '77; half mile run, 1 min, 57; sec., P. T. # OREST 3 TREAM.

NEW YORK, THURSDAY, SEPTEMBER 16, 1880.

A GRAYLING DINNER .- It is not often that any one in this ci y has an opportunity to taste the grayling, one of the most delicate and delicious fish which American waters produce. Thymallus is found only in the waters of the Western British Possessions, in Michigan, and in the streams of Montana, and their appearance in the markets of the East is of very rare occurrence. In fact, it may be said that they are never on sale here, and are only known in New York when some enthusiastic angler brings or sends on a portion of his catch, safely packed in ice

In delicacy of flavor, the grayling yields to no fresh water fish with which we are familiar, while for gamy qualities he is quite the equal of the much praised brook trout. We have caught in Montana, about the head waters of the Missouri River, many of these fish, and we have no hesitation in placing them in the very front rank of American game fish,

We had the pleasure last Friday of renewing our acquaintance, intermitted now for five years, with this beautiful fish. Messrs. Abbey and Imbrie, who had received from Michigan a number of grayling lately caught there by Mr. McMartin, invited a half a dozen veteran anglers to assist in demolishing the fish, and it was our good fortune to be present at the dinner. The grayling, which had been sent on packed in ice, were in superb condition, as fresh apparently as if they had been just drawn from their native waters. As to the company, no true angler but would have said to himself, "it is good to be here." We have caught in our day many fish in many waters, but the exciting stories that passed around board of the capture of gigantic salmon, striped and black bass, and other finny monsters, made us feel that we were indeed but tyros with the rod and

#### BAY SNIPE SHOOTING

III .- BLINDS AND DECOYS

T depends very much upon the character of the place where you go, and the variety of birds which you in tend to shoot, what kind of a blind or bough-house to build for your concealment. If on the edge of some large bay or broadwater, for general shooting a stand may be erected that will screen you while seated on a comfortable bench. But if you select some bar or beach where the birds come to feed at low water; or along which the willet fly, a box sunk in the sand is the most killing de The box should be long enough to allow the gunner to lie in it comfortably, and its width should be several inches in excess of the breadth of his shoulders, From ten to fifteen inches will be of sufficient depth. It should be made of three-fourth inch stuff, calked and pitched on the outside and in, thus making it thoroughly water-tight. At one end, near the top, an iron staple should be clinched, to which a half-inch rope of about seven feet in length should be fastened. This will be found useful in towing the box behind a skiff, or for dragging it over the sand. A useful article will be found in an old spade. Should you find that large birds, such as curlew, marlin and willet, have a roosting place on one of the bald marshes, the box described above should be used, or if thoroughfares dissect the marsh, you can paddle your skiff, which should be painted green, up one of the drains toward the spot where the birds lower their flight, or circle over before alighting, and conceal it in the highest tuft of grass. Curlew, and especially the ' jack," do not stool well where a blind has been erected. They are wary at best and wild when their favorite haunts have an unnatural look. Not so, however, with many of the other varieties. Willet almost invariably stool well. and both the marlins are unsuspecting. The large and small yellow-legs, dowitchers, robin snipe and lesser birds are readily called within reach, providing, of course, that the proper place has been selected. The bars and shoals are the favorite haunts of the black-breast plover, the willet and dowitchers, while the meadow pond-hole are the sure places to attract the yellow-legs, especially when the birds are traveling with the wind, or as baymen call it, a "free wind."

Blinds are easily constructed out of cedar boughs, cut about four feet in length, stuck in the sand or mud. They can also be made, when the wind is not blowing too hard out of long reeds cut on the marsh. We have seen painted canvas screens, hinged so as to fold up, used, and one of Long Island's famous gunners once used an um brella painted green, which served not only to hide his huge proportions, but kept off the fiery heat of the sun. The fact is, as we have said above, it depends very much upon the place, and, moreover, on the conditions of wind and weather where to stool. While a vast number of birds in their autumnal flight follow the irregularities of the coast, there are countless numbers who make their migration far to sea, or take short cuts over the main land. Those passing to sea only touch at the projecting points, and are consequently tame, while those which have run the gauntlet of an even shore or beach are wild. and less likely to stool. All these things must be taken into account, and the wilder the birds the better you must be hid. Sometimes it is impossible or inconvenient to construct a box such as described, or find suitable stuff to build a blind; then a rubber blanket can be spread on the marsh, and a few sedge bushes or heaps of sea-weed placed around you.

The most favorable wind for bay snipe shooting in the summer and autumn is one that blows steadily from the southwest. The birds who are coming from the North, and flying against it, lower their flight and skirt the bars and meadows, and see the stools more plainly and decoy much better than when traveling with the wind in the clouds. A wet sammer is also found to produce the best shooting, as the meadows afford plenty of feed, and should the birds arrive early in the season, they stop and make the large marshes their home, flying north in the morning and returning south toward even-

ing. The birds are then said by bay men to have established "a trade."

One great advantage in shooting in bays and broadwaters, where the tide rises and falls but a few feet or inches, is that the blind can be occupied by the gunner throughout the day, without the annoyance of being driven out at high water. Meadow ponds on this account are often selected, for although they do not afford the best shooting during the morning and evening flights, yet admit of a stationary blind being built from which more or less birds can be shot during the day, particularly when driven from the shoals at high water,

The decoys, or "stools," as they are called, are always to be set to the windward of the blind, and though twenty or thirty are generally used, we prefer to set out about fifty, as the greater the number the better the show to attract the flocks. The stools should be set in a crescentshaped circle, with the heads of the decoys pointing to the wind. There are two reasons for arranging them in this way: First, all wild fowl light to the wind, as they need the resistance of the air; second, a flock of birds that intend to stool, drop down to leeward, where they circle and then draw in over the decoys. It is, therefore, not advisable, as a rule, to shoot at a flock passing over your head, as it will turn, and should it light it will do so at the head of the line of stools. It will thus be seen that as the birds check their flight to alight, they crowd and jostle together, affording the most killing results of a well directed volley into their ranks. There are various kinds of stools manufactured, such as both solid and sectional wooden ones, hollowed out; flat tin stools, cut out of sheet tin, and several years ago a patented tin stool was introduced on the market, that met with favor in the eyes of those sportsmen who cared little for expense. The latter are of very ingenious make, each half of the decoy being concave on the inside and convex on the out, thus representing one-half of a bird; the two parts are hinged together on the back, so that when shut they resemble a well formed snipe, and when open can be packed one in another after the manner of a nest of boxes, and occupy but little space. All these decoys are painted to resemble the different varieties of snipe, and are stuck up by means of sticks. Each set of stools should have sticks, or "legs," of two lengths-short ones when used on dry bars or very shoal water, and long ones when the water is deep. It should be borne in mind that stools set in the water are more readily seen, as their reflection and a watery background make them loom up and show to advantage. For wet stooling, the wooden ones are preferable, as the tin ones soon rust and become worthless. The objection, however, to the wooden stools is their weight and bulk. For plover shooting on the upland or dry ground, the tin ones are by far the best. It may here be said that shells, lumps of mud, etc., placed on sticks, often can be used when it is impossible to obtain the regular decoys.

It sometimes occurs, when snipe are making their flight late in the afternoon, that they are not inclined to stool well. They travel high, and often the decoys are so situated that the flocks run on to them without distinguishing them. In cases like these, a few scattering stools set away to the windward in the line of flight, even if they are stuck up in deep water, will draw the birds down in passing, and then, by judicious calling, the flocks can be worked up within shot.

THE CREEDMOOR MEETING .- With a promise of good weather the eighth annual fall meeting at Creedmoor is progressing at a rapid rate, and in our next issue a full report of all the matches will be given. The team entries were far beyond any previous year, and in the majority of the matches the contests promise to be very close without any breakdowns. In the All-Comers individual matches there are enough entries to make some close shooting necessary for the prize winners. When the regular entry list closed on Saturday evening last, leaving only post entries permissible, there were 213 entries in the Judd Match, with 153 in the All Comers. The Champion's Match had 23, while there were 79 in that for the military championship of the United States. For the Wimbledon Cup there were 21 entries, including

such excellent long-range men as Adee, Burnside, Buck, Todd, Farrow, Hubbard, Lauritzen, Cobb, Allen, David, Ratabone, Day, Fisher, Lumb, Morse and Molnness.

The team matches are, however, the feature of the meeting, and here the effort put forth was the best.

In the International Military Match, in which regulars are pitted against militannen for the Hilton trophy, there are six entries. They are from the States of New York, New Jersey and Pennsylvania, while the regular army is represented in each of its divisions of the Atlantic, Paculic and Missouri by teams.

The Inter-State match for militiamen only will be fought between the States of New York, New Jersey. Pennsylvania and Connecticut. The Inter-State long range for clubs will be fought out by six teams, the Ilion Club, New York, the Massachusetts Rifle Association the Empire Rifle Club, the Amateur Rifle Club, the Penn sylvania State Rifle Association and the Connecticut As sociation being represented. In the Army and Navy Journal match, which is purely military, there are eigh teen teams entered, and from among the commands of this State lifteen teams have been gathered for the State match. The First Division match, which ought to yield a strong fight among the nine regiments of the Metropo lis, has three entries, the Seventh, Eighth and Sixty pinth regiments only coming forward. In the Second Division match, for Brooklyn regiments, the showing is even worse, for the Twenty-third and Fourteenth regi ments are alone represented. The Washington Greys have learned that if they run away they may live to fight another day, and the Cavalry State match is left between the Oswego and Harlem teams. Every club thinks itself capable of good short range work, and there are accordingly fitteen entries for the short range team match, while in the off-hand military team match sixteen entries will make up a lively contest.

Special efforts have been made to have a gathering of notables during the meeting, and with such a wide area of selection for the teams, the interest in the meeting is very general. Col. John Bodine is the executive officer for the first time, and he is assisted in his work by Col. Story, to whom the credit of the present fall meeting system of squadding and time schedules should be given.

#### ALONG THE SHORE.

SUMMER is the time for visiting the seashore. When the country only a few miles from the ocean, sheltered by the woods or the intervening hills, lies baked and simmering under the August sun, breezes fresh and crisp as those of October blow cool from the broad Atlantic, and temper the intense heat till it becomes merely a delicious, languorous warnith. And what wonderful sights one may behold upon the wet beaches, provided he who visits them be truly an observer, and can appreciate the many curious forms of life that are to be found scattered far and wide along the water's edge.

Far away to the eastward stretches the intensely blusea, sometimes smooth and smilling, clear as the sky above it, or again sparkling with white-tipped waves, that flash merrily in the sunlight and invite one to pushoff his bark from the shore and sail away toward the blue water beyond, where sea and sky seem to meet. Not less inviting is the roaring surf off the wide beach, where the giant rollers come pouring in in regular succession, each one forcing the retreat of the busy groups of beach birds, which turn on its reflux and hastily follow back the retreating waters. Behind us, to the westward, is the bay, backed by several miles of low marshes, intersected by numerous inlets, and beyond these meadows appear the low hills of the mainland, crowned with feathery pines and dotted with white farm buildings.

We recently visited the eastern shore of Virginia, and during the few days which we were enabled to spend along this delightful coast, enjoyed to the full its many charms.

We left New York one Wednesday on the steamship Breakwater, Capt. Gibbs, of the Old Dominion Line; a new vessel of about 1,000 tons burden, fitted up in a most comfortable, not to to say luxurious style. The sail down the coast in such a vessel-so fast, so well-managed and with such pleasant officers-is most delightful, and we are sure that were it generally known that so pleasant an excursion could be made so quickly and cheaply, the Breakwater's passenger list would be a large one each trip. The traveler can leave New York at 3 P.M., and reaching Lewes, Del., early next morning, can spend the day there until 3 o'clock, when the steamer starts again for New York, which is reached before daylight on the following morning. At Lewes there is good fishing, and weakfish, spots, croakers and blackfish are caught in considerable numbers. At certain seasons the salt mea dows are alive with bay snipe, and there is said to be fair quail shooting back from the shore,

From Lewes we took the Junction and Breakwater Railroad to Franklin City, Md. From this point a small steamer takes us to Chincoteague—famous for its oysters, its crabs, its terrapin, its bay snipe and its ponies. Here it is that the somewhat famous pony penning takes place each year; a performance, however, which, owing to the gradually lessening size of the herd, is

much less interesting now than it used to be. At Chincoteague we spent a short time at the excellent Atlantic Hotel, kept by Messrs. S. E. Matthews & Co., while the preparations for our trip were being made, and then having secured a small yacht, with Capt. Claval as skipper and a four foot darkey as steward, weighed anchor to spend a few days along the shore. Our ostensible object was to shoot bay spipe, but the event proved that we were too early for the birds, and no very large bags were made. Willets, dowitchers, great and lesser yellow-legs fell to our guns in goodly numbers, and a few curiew and marlin were killed, but there was no great flight, such as we had hoped for. The pleasures of the excursion, however, were such that we scarcely missed the shooting. With what lazy delight we dozed upon the deck in the warm sunlight while our lively little vessel skimmed over the waves. How interesting to watch the great schools of menhaden flashing at the surface of the water, while at intervals the triangular fin of a shark was to be seen at the edge of the mass, carrying terror to the crowded fish that were nearest to him.

During the middle of the day we sail from one point to another, the morning and the evening being employed in We set out our stools either along the beach, just out of reach of the surf, or else on the meadows at the edge of some little pond hole. It is better to shoot on rising water, as the birds, when they are driven off the flats by the tide, fly hither and thither seeking some feeding ground which is still uncovered. As a rule, large decoys are better than small ones, for the small birds are attracted by, and will alight to, large stools, but large snipe, such as curlew, marlin and plover, will not come to small ones. We have, then, a lot of curlew, willet, yelper and black-breast stools, and we marshal them in the most imposing fashion, so that the flock of fifty or sixty mimic bay snipe make a very good show. A hollow scraped out of the sand, if we are on the surf, or a bunch of tall grass, or perhaps some boughs cut from the low sand bushes, if on the meadow, form our blind, and we are soon snugly concealed. Before long the soft, mellow and long drawn out whistle of a black-breast plover, the ringing call of a jack curlew, or the harsh scream of a willet falls upon the ear and is answered from the blind; the birds draw near, and, seeing the stools, change their course and rapidly approach us. How beautiful it is to watch the wary jacks or plover high in air swing over the stools to leeward, calling at frequent intervals to their supposed comrades below, and receiving deceptive answers from the blind. At last they set their wings and swing down close over the stools, their long legs dangling and their bodies crowding together as they prepare to alight. We rise from the blind, the four barrels sound in quick succession, and the dead and dying strew the ground, while the survivors, with hurried wing-beats, rise in the air and start to fly off. Again the delusive whistle sounds from the blind, and if the birds are willets or dowitchers they will very likely swing round again and again until their ranks are sadly thinned. Sometimes a little flock of oyster-catchers (Haematopus palliatus) flies along the beach, uttering at intervals their short, sharp cry, and when it is replied to from the blind noticing and turning in toward the stools. They are wonderfully tough birds, and it takes a great deal of shooting to bring them down. These birds are called, along the Virginia shore, sea crows; for what reason it would be hard to say. In their livery of white and sooty brown, with their red bills and long, flesh-colored legs, they are as little like crows as any bird that flies. The thin compressed beak of this species is curiously adapted for being introduced into partially opened bivalve shells, and the shore men relate that when the bird sees a clam or an oyster with its shell part way open it steals up to it and quickly thrusting in the knife-like mandibles "cuts its heart." It probably cuts the muscles which hold together the two valves, so that its victim is no longer able to close its shell, and is devoured at leisure.

When there comes a lull in the flight we are at liberty to rise and stretch our legs. We light our pipes and re-cline at full length on the beach in the warm sun. At a little distance from us is a throng of the smaller beach birds-peeps, oxeyes and the smaller plover. They run busily about, some following the retreating waters and snatching savory morsels from the very surf, and others probing the wet sand until it is honeycombed with the marks of their bills. Among them are several birds very pale in color, which we do not recognize at once. These, on closer inspection, prove to be the Wilson's plover Ægialitis wilsonius), dainty little birds which are seldom seen as far North as New York. Occasionally one or two willets join the group of smaller birds and feed with them. They, too, probe the sand for food, thrusting their bills in up to the nostrils with action much like that of the Wilson's snipe.

As we sit waiting for the bay birds to come in we are critically inspected by all the feathered multitude that get their living along the shore. An osprey, whose fishing we have been watching with interest for some time, having caught a good-sized "spot" (Ligostomus obliquus), passes close over us on his way home, and whistles shrilly as he eyes us. The black-headed gulls (Larus atricilla) sail slowly along the beach, and when they pass us take

a circle or two about our heads in order that they may have a good look at us. Of the little terns there are half a dozen species to be seen. They fly restlessly about and are ridiculously tame. Sea swallows, they are well called, and few birds equal them either in purity and beauty of plumage or grace of flight. But they are cross and peevish little birds, and evidently think there is something suspicious about us and our stools, for as they pass backward and forward over us they utter complaining grating cries and sweep so close to our heads that we are tempted to throw at them some of the shells with which the beach is strevn.

The shearwaters (Rynchops nigra) or, as they are here called, skimmers or flood gulls, are not less tame. They would fly in low wide circles about us, so close that they were almost within reach of our gun barrels, constantly uttering their smooth low croaking notes, and eyeing us with an appearance of the greatest curiosity. Sometimes, after a long inspection from above, they would alight on the sand within twenty or thirty feet of our blind and stand there creaking for a few moments, when, if no movement was made to disturb them, they would sit down on the sand and doze until frightened away by our whistling or our shots. On the ground they are grotesque objects, but while flying they are beautiful birds, the black and white of the plumage being very striking, and contrasting with the bright red of the bill. They are called flood gulls, from the supposed fact that on a rising water they fly over one, calling loudly, but are silent at other times. We frequently, however, during our stay, heard them calling on the ebb tide. The reason for their name of skimmer will be evident enough to any one who has ever seen them feed. They flap slowly along over the water, the mouth wide open, the lower mandible immersed, and seem to feed indifferently over the open waters, the pondholes and the tidewater channels that intersect the marshes. One that we watched for a long time was observed to follow a school of small fish, and his stomach, when opened, was found to contain two small minnows and several shrimp, besides a quantity of partially digested matter which could not be identified. It is highly probable, however, that the food of the shearwater consists largely of small crustaceans. We often saw them feeding in the late dusk, and heard their cries at midnight.

In the surf on the outer beaches of this coast there is often fine fishing for drums (Pogonias chromis), which are caught by a squid thrown from the beach, the fish weighing from twenty to seventy pounds. In many places the beaches are thronged with small sea crabs, which excavate for themselves deep burrows near high water mark, to which, on the approach of man, they betake themselves with great swiftness. They have short heavy bodies about the size of an egg, are yellowish in color, with short stout white "nippers." In many places the beach is covered with their tracks, which greatly remind one of some of the tracks on the Triassic sandstones of the Connecticut Valley. The drum fish are said to feed to a considerable extent on these crabs, which, we are told, they dig out of the sand at high water.

There is so much of interest to be seen about such a shore, where earth, air and water swarm with different forms of animal life, that it cannot all be compressed into one brief note. We should like to tell of the weakfish in the inlets, the softshell crabs and oysters of the shallow bays, the meadow hens which throng the marshes, and the delicious fruits of the mainland. Our pen floating airily from one topic to another should touch, too, with its light point the gigantic mosquitos of Wallop's Beach and the intense heat of one quiet mooniit night, which prevented sleep and made life for the time being a burden. There were of course a few drawbacks to the delights of our excursion, but on the whole it was full of pleasures, and its memories will long remain with us.

#### ANGLING CONTESTS.

HE angling clubs of London are much given to competitive angling of a sort which, we hope, will never be introduced in America, or, if so introduced, we sincerely hope they will be a short lived novelty. Nothing can be more foreign to the quiet and gentlemanly spirit of the angler than these contests. Imagine, if you can, the feelings of horror with which the "good old Izaak," or our own Norris, would view a crowd of men intent upon catching the greatest number of fish in a given time, for a plated cup or teapot! Surely this is the very opposite of the contemplative man's recreation, and places it on the level of those highly intellectual games played at rural fairs, as sack races, catching the oleaginous porker, climbing the greased pole, and grinning through horse collars, or to gambling pedestrian matches and the like.

We would not include the very good custom of a prize or a supper to the captor of the largest fish in the course of an angling season, as we believe to be the custom of some of our American clubs, among the kind of angling contests under consideration, but refer particularly to the practice which has, within a few years, obtained among our English cousins, of going out in a party for a day and fishing for dear life for a prize to be given for the greatest number of fish, paying an entrance fee and going at it like a race-horse, a practice which seems to us to be so foreign to the true angling spirit that we think they should be called fish-killing contests in place of the present title. Lest any think we may have exaggerated what we speak of, we quote the following from the Fishing Gazette, of London, headed "Another Great Angling Contest," which says:—

On Monday 'last another of those great angling contests, for which Shettled is so noted, took piece at Crowle, near Thorne, South Yorkshire. This was the tenth annual match got up by Mr. Jarvis Sanderson, the host of the Crown Inn, Scottand street, Shettled, and the house of nativity for Shettled angling clubs. On this occasion Mr. Sanderson offered fifty guineas and nearly rehundred otherwise the shet of the Crown of the Crow one hundred other prizes, the gifts of his friends, and from other sources. Being Bank Holiday there was a vast influx of visitors to this quiet little village on the Keadby Canal, the battle-ground of the many like affairs in days gone by, and the rendezvous, the South Yorkshire Hotel, was once more the center of an un equalled scene in angling, as it is generally understood. Some 700 or 800 followers of the gentle art were gathered together, mostly from Sheffleid, but there were also many Irom London, Barnsley, Doncaster, Wakefleid, Hull, Peterborough and distant wards of 370 paid the necessary entrance, three soluginal discuming to compete, and the ground taken up extended nearly five miles from end to end. The weather, to begin with, was pretty favorafrom end to end. The weather, to begio with, was pretty favora-ble, but during the afternoon a beavy thunderstorm passed over the district and douched the anglers not a little; but, like, good followers of old Lasak, they stuck to their work as a rule, and went gamely on. After fishing nearly four hours it was found most of the takes were small. B. Brown, of Sthefiled, outfid the others with five pounds and three fourths of an ounce; J. Rother-burn, of the same place, being at his beels with three pounds and thirteen ounces, and H. Barber also got three pounds and two ounces. The smallness of the takes, however, was accounted for The smallness of the takes, however, was accounted for as usual, by the fish not being on the feed; but it may be remarked has usual, by the last not coing on the feed; but it may be remarked that a wag suggested that enough "ground bait" had been thrown into the water about here to take the fish all the season to consume. Whether that is so or not, it is possible the fish have got so sume. It is hit is so or took, it is possible the sin are got an one that can now be the toolish ones that can now be the toolish ones that can now be the toolish of the toolish of the took of the t At all events, large or small "takes" are always welcome in match at Crowle, and it matters little whether the aggregate

We dislike fishing for count or brag in any shape; dislike to fish with a person who braggingly refers to his catch should it happen to be the largest in the party; dislike to have the question of beating come up in any shape to show that there is any spirit of rivalry in the company which, if composed of quiet, unobtrusive gentlemen (this in contradistinction to the noisy gentlemen), as it should be, is entirely out of place, and it is ques tionable if it is good policy to publish the fishing score of a party when its only object appears to be to show who caught the most. There are conditions when a score appears to some advantage, as, when it shows that the fishing is good or had in waters little known, or which have been recently stocked, but nothing can be in worse taste than to fish with a friend and then brag because you were either more skillful or fortunate than he, by the brag direct, speaking boastfully of it, or the brag indirect, publishing the score where your large figures make his small ones hide their heads, while you appear to be merely stating facts without the appearance of boasting.

Certainly the man who catches so many fish in a day that their number seems so great that one must apply his arithmetic to ascertain if it be possible, or to learn how many were taken in a minute, cannot have what an angfer would call sport. The suspicion immediately arises that he used coarse tackle, and "yanked" or "snaked" them out, both these expressions are used by such peo-ple, and an angler would prefer an hour's fight with a salmon or a proportionate time with a trout, according to its weight, to the entire catch of the other, and we cry shame on the man who will kill his hundreds of fingerling trout or grayling just to brag of or " just to say that I killed them.'

Lord Chesterfield's son appeared before him as black as a chimney sweep, and, in answer, said that he had been down in a coal mine. His astonished parent asked his reason for going into that dirty place. "Just to say I've been there," answered the son. "And couldn't you say so without befouling yourself by going?" was the next question. That is our idea; if it is necessary to say so, we would have just as much respect for Mr. Smallduffer if we knew that he lied about it as we would if we knew that he had been criminally hoggish enough to actually kill hundreds of fingerlings which neither afforded sport nor food, for we have passed that age when we can believe it possible for a man to kill 200 fair trout in a working day of ten hours, and do it in a sportsmanlike manner. Even if it were possible, what is the use who wants to fish ten hours a day? Our idea of angling is recreation, and many a good day's enjoyment is remembered when the catch amounted to little or nothing, but the company and the surroundings were glorious, when the secrets of the untrodden forest were in part opened, and the wild duck led her downy young almost upon the boat anchored just around the point, or the mink was frightened at the sight of the infrequent man in his path.

The literature of angling contains nothing on the subject of contests until within a few years, and all its tradi-

tions are opposed to them, and unless a man is fishing for market, we do not see wherein the size of his catch has anything to do with his legitimate pleasure, unless he should catch an extraordinarily large specimen, when it is perfectly regular to publicly announce it, thereby establishing a fact concerning the size which it is possible for a fish to attain in a certain locality, but deliver us from the angling contest gotten up to attract custom to the bar of a public house. Our gorge rises at it.

GAME PROTECTION IN WYOMING,-Advices from Wyoming Territory give us reason to hope that before long a stop will be put to the reckless slaughter of lurge game which has for years been going on there. Up to within a short time there has been every prospect that Wyoming would soon be as bare of large game as is a large part of Colorado. But the formation of a game protect tive association, with some energetic men at its head, now seems to promise better things.

We learn from one of the most prominent members of this association that no efforts will be spared to convict every man who can be found killing game for any other purpose than to procure necessary food. We hope that this will be done, and if it is, the slaughterers will have a bad time of it. It is true that some who are innocent of any wholesale killing may suffer with the guilty. But at all events such action will tend to keep those who kill simply for the sake of killing, and to boast of their large bags, out of the country. We understand that special efforts are being made to convict a certain alien now in the mountains, and if these attempts are successful, we shall be glad to announce the fact.

We have no doubt that special attention will be paid by the game protectors in Wyoming to the skin hunter, that curse of the frontier, that has depopulated so many of the finest hunting grounds of the West of its hoofed game. No punishment is severe enough for these scoundrels.

THE GAME FISH OF TEXAS .- We earnestly request our angling readers to read Dr. Henshall's letter v above title and paste it in their memories. We have went over the confusion of names of the fishes, and are prepared to weep again as soon as the onion crop is harv ested, over the persistency of local error. Dr. Henshall deserves the thanks of all lovers of angling for his efforts to set the nomenclature in the right groove, and we hope that our readers will assist him by using these common names. No matter if you have called a bass a trout all your life and it comes awkward at first to call it any thing else, you were wrong; the usage of the civilized world is against you and says that no trout has spinous rays in its fins. If we had not wept so much over this subject we would try and wring a few tears out of our handkerchief over the pike perch that is called a "salmon in the Susquehanna, Mississippi, Ohio and other rivers. but alas! even the handkerchief has felt the effect of the drouth and we await the pungent onion,

THE CANADIAN KENNEL CLUB.-We are heartily glad to hear of the formation of the Canadian Kennel Club, and have no doubt that it will, though young, attain be fore long a stout and vigorous growth. Certainly there is no reason why it should not be in every way successful, supported as it is by some of the best sportsmen and most prominent kennel owners of the Province of Ontario. We expect before long to hear more of the Cana dian Kennel Club.

THE HABITS OF SALMON .- We would call attention to the very interesting letter from Prof. Hind, on this subject, in another place. It is very evident that there are some people in the Dominion who dislike to have the habits of salmon discussed, unless by some one who is in entire accord with their own preconceived views. do not include in this category our own correspondent "Stanstead," who respectfully differs with Prof. Hind, and asks him for proof of the statements which the latter has made. This is of course perfectly right, but it seems that others have allowed themselves to indulge in the silly practice of calling names, and personally abusing a gentleman who dares to give his views upon the movements of salmon, a course which never fails to injure those who practice it. We have no opinion to express concerning the merits of this controversy, and are not only willing, but glad, to give both sides a fair chance to express their opinions; merely asking that they do it in a fair and gentlemanly manner. In fact, when a person loses temper in an argument, they not only lose the confidence of the community in the justness of their cause, but create a suspicion that they have an object in keeping the truth from the public.

Discussions on this subject tend to throw light upon obscured points, and advance our knowledge of the hab its of our fishes, and no man has any right to take offense at the expression of an opinion which differs from his. We do not pretend to understand the reasons which make some of our neighbors over the line so jealous of a discussion of a perfectly legitimate subject.

The Sportsman Courist.

ROUGH NOTES FROM THE WOODS.

CAMPS IN THE WILDERNESS—HOW THEY ARE ORGANIZED,
OWNED AND MANAGED—HOW THE OWNERS LIVE
AND WHAT THEY LIVE ON—GUIDES, GUIDING, BOATS AND BOATING—A WORD FURTHER OF HOTELS AND HOTEL KEEPERS

HE camps of the wilderness deserve a special notice. Their name is legion and they are increasing at a rate that defies calculation.

THE camps of the wilderness deserve a special notice. Their name is legion and they are increasing at a rate that defies calculation.

Let us start at the very foot of the Fulton Chain, not at the Forge House, but below, at the huge dam, controlled by the State, and used to draw off the lakes for public use, i.e., to feed canaly, reservoirs and other State works, and the state of the channel proper, now one and a hulf and store of the effects of civilization and progress. Stretching away to the dense green timber of what is now the mainland, there is a desolate waste of dead, decaying trees, lifting their bare broken arms toward heaven in ghastly protest against the arborean murderers who tortured them to death by slow drowning. Motionless in the fiercest storm they stand with their dead feet and legs in the dull seduy marsh. Almost imperishable, they have slood there for more than a generation, and a generation yet unborn will see the same ghastly sight. The sight is such a picture of desolation that, padding down the lake by moonlight, I am careful to be always looking the other way. On the Woodhull lakes, on the Beaver, on the Oswegatchie and a dozen other waters, the same desolate sight pains the eye of any tourist or lover of nature who may chance to pass these wearisome "drowned lands." But more of this anon.

The line of dead "hop-poles," as they put it here, extends for about a mile, with a trend to the southward as you pass into the clear water of First Lake. Rounding the bend of a tall thick pine. Below are buildings of some pretension. Two well appointed log houses, one for the gales have been dead to the control of the sunday state of the analyty of trout and venison.

Rounding the point on which Camp Stickney stands, you see at your left, half way up Second Lake, a poplurovered to the state of the state of the state of

get. But this is digressing.
Every boat that passes up or down these lakes must of course go up or down by inlet or outlet, and they must pass directly in front of Bucill's Camp. Passing up the inlet, it is about eighty roots from this camp to the foot of Fourth Lake, and passing along the northern shore of this lake, rounding a sandy along the northern shore of this lake, rounding a sandy along the northern shore of this lake, rounding a sandy soling marked by a solitary dead pine, you come to the pight to consist of the sand opposite is the "Camp Chapit," party consisting of two young men from Rochester, with consumptive tendencies. I stopped there several times, and found that their guide, Fred Rivet, was faithful in the performance of his duties so far as the supply of trout and venison was concerned; but I did not detect any coughs or other evidence of pulmonary difficulty. The vitals of the party seemed, to an outsider, all right enough, But I noticed a decided consumption of victuals, with some drink. By the way, it is claimed that the trout, or salmon, are larger and of better flavor in the Fourth than in the other lakes. And I may mention that the Chapin Camp guide stands "high hook" on the Fourth, with a salmon weighing twelve pounds as his record.

But a word for the Little Moose Lake. The largest salmon caught in these waters was caught on Little Moose, by a Mr. Miller. The fish weighed, by scale, twenty-five

mon caught in these waters was caught on Little Moose, by a Mr. Miller. The fish weighed, by scale, twenty-five and one-half pounds, and was of excellent flavor.

The average of these lakes, which it is sacrilege here to call anything but salmon, is just about two and one-half pounds. And they are exceedingly fine on the table, better than speckled trout, to my thinking, in which I am corroborated by nearly every guide and angler on these waters. I have passed by the camps on Little Moose. They are three, with open, bark camps, that any one may occupy, thrown in. And it is one of the finest lakes on the Moose waters. Passing up the Fourth, the first camp above the Snyder is Sam Dunakin's—Honest Sam Dunakin. Whitskey-loving Sam; one of the oldest guides in the Adirondacks. Faithful to his party, be the same a party of one or comprising women and children, with a nutsance in the shape of pater familias thrown in. Always competent, always sober (on duty), no guide can take you to more places by more direct routes or take care of you better than Sam. God forgive him the foarful lies he tried to get down me, as he, being out can take you to mind places by more thanks of the control to take care, of you better than Sam. God forgive him the fearful lies he tried to get down me, as he, being out of a party just then, got me to paddle up and pass the night with him.

The next camp is Ed. Arnold's, across the lake, in a

of a party just then, got me to paddle up and pass the night with him.

The next camp is Ed. Arnold's, across the lake, in a pleasant grove, and with accommodations for a rather large party. Ed. is, and has been for many years, a guide; one of the oldest. Born on these waters, he has passed his life in the wilderness. Like Mitchell Sabatis, Sam Dunakin and other of the old guides, the routes of the wilderness to him are as streets of the city to a cockney. He keeps a woods hostelrie, but takes parties to guide, and he guides them well.

The "Lawrence Camp," the "Turin Camp," the "Pratt Camp," the "Bissell Camp," all on the Fourth, are but repetitions of those already described. If these camps give any correct idea of the way and manner of living in the North Woods, at the western side, how is it on the other side, where daily lines of stages bring loads of passengers each day; where horses and men are stationed at the "carries," to take guides, boats and parties across, and telegraph wires, steamers, high-priced hotels, billiards, boats, pianos, croquet grounds and all the concomiants of a high-priced watering place prevail?

The days of the hermit hunter have passed away forever, so lar as this wilderness is concerned. The deer are disappearing rapidly and the trout are being thinned out at a deplorable rate.

It is true that the camps able to employ skillful guides manage to have a fair supply of trout and venison, but it costs them more than a doular to the pound. All the same, it is a dreamy, sylvan, delightful life to live, and not as expensive as Long Branen, or Newport; but, to my thinking, far preferable.

And what of the guides—the men who honestly and earnestly believe themselves entitled to the rights of sovereignty over the whole domain of the Northern Wilderness? And are they so very far wrong? One guide said in my hearing, "We take our parties to the houses that treat us best. They always go where we say. If a landord wants to go back on the guides, well, he can try it on."

on."
Yes, the guide is a leading and controlling element of the North Woods. He has salient points of character well worth noting, because, sooner than he thinks, perhaps, his vocation will have passed away. Already on the eastern side of the wilderness he is out of the regular jobs so easily obtainable in the days of "Murray's Fools," and even now, on the western side, where the independent

dent system prevails. The wilderness g

dent system prevails.

The whiterness guide deserves special note. He is a specimen of the genus homo that I have nowhere else seen; and, whatever, he may think, destined soon to pass away forever. His present conviction is that the havent of first-class hotels, stage coaches and steamers is pass away forever. Its present contractor is that the advent of intra-class hotels, stage coaches and steamers is fatted to run the guide business, and he is doubtless right. At present he remains in pristine vigor, and it is worth white to note his most prominent curracteristics while he is to the fore. Firstly, your guide must be familiar with a portion at least of the leading routes through the wilderness. Secondly, he must have the muscle of a carthorse, because the third requisite is a boat of "the Long Lute model," weighing, with oars, seats and neck-yoke, So to 100 pounds. Argument will not convince him that the world can produce a better or lighter boat fit for guiding. Show him a Rushiton model, light, strong, weatherly and weighing forty-live pounds, and he will say since is slow; he wants a boat that "he can get somewhere with." It does not occur to him that he is workness and connectable boat, and that if he made somewhat less speed his parry would be just as well satisfied, what it does speed his parry would be just as well satisfied, what it does not be come the present a speed his parry would be just as well satisfied, what it does not be come to be presented as a supposed to the first of the present and connectable boat, and that if he made somewhat less speed his parry would be just as well satisfied, what is the desires. -just what he desires.

—just what he desires.

And so he fits himself for guiding and awaits his "party," If he he an old and well-known guide, probably he is engaged to meet a party say at the Moose River House, or at the Forge House. At the appointed time he is on the spot, his boat cleanly sponged, himself in condition to take care of his party of one or two. Suppose you are the party—of one. Business detains you, and you are a week benind the appointed time. "It is of no consequence—not the slightest." Your faithful guide is there quence—not the slightest." the party—of one. Business detains you, and you are a week beamind the appointed time. "It is of no consequence—not the stigntest." Your faithful guide is there with his boat; has been there for a week, and has a bill against you as follows: "Guide's services, \$18; Hotel, \$i." You are a little sore, but conclude to make the best of it; and, after all, is it not just? You made the bargain and appointment. Guide has been faithful to his tryst. You cannot get out of it honorably; so, you succumb, and, being bent on a good time, get cheerful and invite guide to "lake something." You are on the right tack there. One of his best "holts" is to take something. But you have had enough of hotels; you did not come for that, and you suggest an immediate start. Guide is ready—has been ready for a week. And he commences emptying his old shirts and overalls from an immense affair, looking for all the world versalls trom an immense affair, looking for all the world this as the mevitable pack-basket of the wilderness. This is the mevitable pack-basket of the wilderness. Shaped for the human back, and holding a bushel of protations, clothing or anything you chose to put into it, without jamming or mussing it, it is far ahead of any knapsack I ever carried. But bewere how you fill it, betause when your guide earries an eighty-live pound boat, with a gun and a fishing-rod or two, across a heavy carry, the plack-basket will either fail on your shoulders or you will have to "double the carry." You do not understand that as you order bread, butter, canned goods, tea, sugar, coftee and all the eatables you can think or the leastive landlord can suggest, until the guide him.

that the pack-basket is about full. Then you desist, and begin to contrive how to carry your extra clothing, etc. The guide is constant with advice and assistance. When the basket will hold no more, he makes up your extra duffle in a neat blanket roll, and announces his readiness to start. As you take your share of dunnage to the landing, it dawns on your mind that you might have got along with less weight; but it is too late to mend that, and you place the impedimenta amidships of the long, cranky boat, creep into the stern, while the guide holds the bow firmly, and, guide seizing oars, you are off up the lakes at a speed of six knots an hour. Your destination is Beaver via Raquette and Forked Lakes, thence across by the ponds and carries from Little Forked Lake to Little Tupper, then by Charley Pond to Smith's Lake and the Beaver. Guide advises a different route, taking in Long Lake, Big Brook, Slim Pond, Stony Pond, etc. You go over the map with him, and accept the change, It is a longer route, but more pleasant, takes in more country and there is less carrying. At the head of Fifth Lake you begin to realize what a carry means, Guide hauls his boat out in a way that means business, makes our and seats fast, done his neck-yoke, takes as much more as he can possibly handle, and walks off with the inverted boat covering him from sight—all but his legs. Your load is the pack-basket, a blanket roll, gun and rods, weighing seventy-five to eighty pounds; not less. Before you reach the upper landing the perspiration is running from every pore, and you are winded. A rather long pull over the Sixth and Seventh restores your wind, but when the hoot is hauled out for the carry from Seventh the Cighth, which is over a mile, you snivey on your load, You can't stand such infernal loads in hot weather. You will carry the basket over first, and come back for the rest. Guide thinks you had better take it all at once; that the pack-basket is about full. Then you desist, and load, You can't stand such infernal loads in hot weather. You will carry the basket over first, and come back for the rest. Guide thinks you had better take it all at once; it just makes three times as much trouble to "double carry," and you can go slow and rest often as you please. And again you follow a pair of legs and a blue boat over a carry, arriving at the Eighth Lake in a limp and exhausted state, and with a firm resolve never to carry that load again. Arriving at the carry from Eighth Lake to Brown's Tract Inlet, you proceed to divide your load accordingly, and express your unalterable resolve to double trip the carry anyway. Guide is all sympathy and considerations. cordingly, and express your unalterable resolve to double trip the carry anyway. Guide is all sympathy and complaisance. "You needn't do that," he says; "just take your gun and rod. I'll come back for the basket and roll while you rest. You aim't used to packing." Sure enough. Why not? You have engaged him for two weeks at \$3 per day and found; you are to pay him for a week you did not have him. What odds can it make to him whether he puts in more or less of the time making carries? Thus you reason, and reason soundly, to my thinking. But the average guide can Daball the sum total of a trip through the woods in a way and manner to strike a him whether he puts in more or less of the time making carries? Thus you reason, and reason soundly, to my thinking. But the average guide can Daball the sum total of a trip through the woods in a way and manner to strike a professional accountant dumb. Well, you have "come down." Henceforward you are as wax in the hands of your guide. You sit down by the sluggish waters of Brown's Tract Inlettand claw madly at punkies and black flies, while guide doubles the carry. After this he doubles all the carries, and you take it easy. It is what you came for. Very pleasant it is to be rowed at leisure through a wooded, romantic, mountainous country by a man who kn was the lay of the land, the best places for "floating" and all the favorite springholes where trout do most abound. You are never short of trout, and guide pronisesy ou a shot at deer as soon as you get a little off the main route. He takes the best of care that you get neither wet, tired or hungry. You are his party. For the most part you stop at one of the many forest hotels for the night, where they will cook your trout in the best manner, and give you food and rest at which no reasonable man will cavil.

And so through the long, pleasant, summer days, just

And so through the long, pleasant, summer days, just And so through the long, pleasant, summer days, just cool enough for comfort, you glide over these tiny summer seas, up inlets, down outlets, down clear streams, not hurrying, ignoring time, losing the date of the month and day of the week, until at length, with little fatigue and much pleasure, you arrive at your destination on the upper waters of the Beaver.

upper waters of the Beaver.

Guide has an interest in a good bark camp here, to which he takes you, and while you try your fly-rod at a spring hole which he shows you he proceeds to make the camp comfortable and arrange [matters for a ten days sojourn in camp. Your fishing is a success, and when you return you find a pleasant fire, fresh browse on the bed, and all your multifarious traps arranged just to your

you return you must be peased they arranged just to your notion. Guide cooks a trout supper that you think equal to anything you ever tasted, hastily disposes of the dishes, dives into some recess in the back end of the camp and brings forth a jack with material for a light.

"You must shoot a deer to-night; this camp needs venison," he says. You are agreeable.

"Ever shoot a deer by jack-light?" he asks. You confess you never did. Then he instructs you how to do it. The gist of which his, be perfectly cool, shoot when he tells you, and by all means aim tow. Most people overshoot by jack-light, he remarks. Before 10 P.M., at which time you are to push out, you begin to get a little nervous, but at last guide announces that time is up, and the oars are laid aside, light burning brightly at the bow, you are placed properly with final instructions, and the oat glides silently into the clear water of the lake. For you are placed properly with final instructions, and the boat glides sliently into the clear water of the lake. For ten minutes you move thus, and then the low lisping of the lily pads, as they are slowly sucked under by prow or paddle, becomes just audible. Fifteen minutes of this—twenty, perhaps—and the guide whispers hoarsely, "there's a doe; see her?" The boat is swinging slowly to the right, and—yes, there she stands, up to her belly among the pads, her eyes looking like illuminated blue glass. "Shoot," says a hoarse whisper behind you, and you shoot. There is a plashing and spattering of water, a trampling on the bank; and the doe has vanished. For once the grude loses patience.

a trampling on the bank, and the dos has vanished. For once the guide loses patience.

"Why, what ails you? The deer wasn't four rods off," he says, crossly.

"Damfino," you answer, in the same spirit. Guide recovers his temper at once.

"Never mind; we'll find another," he says.

You are not so sure. But the boat, impelled by that noiseless paddle, glides over weeds, grass and pads for nearly an hour, and there, right before you, stands another deer. This time you are wiser and cooler; guide says nothing. He sees that you see, and the deft manner in which he quickly and silently turns the boat, that you may shoot without changing position, is a perfect piece of woodcraft.

Again there is an explosion of saltpeter and brimstone, followed this time by a continuous plashing and floundering in the water that bespeaks a fallen deer.

"You've got him this time; nice yearling buck," says guide, cheerily.

Yes, you have got him. Half a dozen large buckshot through shoulders and "lights" have finished his run-

through shoulders and "lights" have finished his running.

Guide soon has him in the boat, and you start for camp, the direction of which is a sybilline mystery to you, but ten minutes of vigorous paddling brings you there, and guide says, "now you turn in; it's after midnight, and I ain't going to get you tired out and sick. Turn in; I'll take care of the venison." You obey, believing you are not at all sleepy, however. But in five minutes you are asleep, and the san is sining brightly when you next open your eyes. Guide is missing. Going to the spring you find him there, and he shows with some pride his cellar, where he has neatly stored the venison. It is a cache in the side of the ravine, scooped out with much pains and labor, and cool as an ice-house. "It will keep meat fresh more than a week," he says. And he is right. And just here it dawns on your mind that your vocation is gone. You came to the North Woods to recuperate, to botanize, to climb mountains, and live for a few days a free, careless life of the Daniel Boone type. Well, you have caught and eaten trout to your satisfaction, and you wanted a change to venison. You have it. What humane excuse can you have for catching another trout of toating another deer until your present supply runs short? Even if you desired to do it, your guide would go back on and discourage every attempt at fishing or lunning. And he is right. He will tell you plainly that deer and trout are getting too scarce to be wasted, And so, with a week's time ahead of you, and the knowledge in your heart of hearts that bunting and fishing were the main incentives that brought you here, you refrain from both. Notwithstanding, the time passes pleasantly—you row and paddle, climb the hills, go over to the next lake, smoke, sleep and eat—ye gods, how you do est—and rest, and enjoy yourself. You half wish the venison would spoil, that you might have an excuse to shoot another. But guide takes care of that. And what a cook the fellow is.

"It's lucky we brought the beavy on the carries, Guide soon has him in the boat, and you start for camp

venison would spoil, that you might have an excuse to shoot another. But guide takes care of that. And what a cook the fellow is. "It's luckly we brought the 'potatoes and onions," he says. "They were a little heavy on the carries, but we couldn't make a stow without them."

And his soups and stows are about perfect, while his broiled steak is a thing to "thank God on." Just at the last end comes in another party of two, with a guide, and your guide, seeing that you have more ventson than you can use, divides with them liberally, and after a long visit they go over to the next lake, where they are to came.

visit they go over to the next mac, where they die to camp.

On the following morning you pack up and are off to Wardwell's, where you discharge and pay off your guide, and go back to civilization again. You are in no burry; guide's time is not out until sundown, and you take it easy. But, when you come to settle, in the evening, you tind relations have slightly changed. Hitherto, you had been guide's special charge and care. Now, his time is out; he must look for another party. You call for his bill, which he make as out follows:

"You know," he says, "there was a week I waited at the Forge House. Call that \$18 (it was really \$21); paid my own expenses, \$7, "Makes \$55. Fourteen days' guidny own expenses, \$7, "Makes \$55. Fourteen days' guidnig, \$42, makes \$67. Then there was extra work; guess I'll call that \$10—ought to be more."

Extra work?" You ask, in blank astonishment.

ing, \$42, makes \$25. Fourteen days guiding, \$42, makes \$67. Then there was extra work; guese I'll call that \$10—ought to be more.

"Extra work?" you ask, in blank astonishment.

"Yes," he says, calmly, "Doubling the carries. You see, yourself, that every time you double a carry, it makes just three times the distance to go over. For instance: Brown's Tract inlet, mile an' a half. Go back, an' come back again, three miles, making four miles an' a half; an' ioss so with. instance: Brown's Tract inlet, mile an' a half. Go back, an' come back again, three miles, making four miles an' a half; an' jess so with all the carries I made from there to the Beaver. No gentleman, ever since I was a guide, ever asked me to do that work, without being

willing to pay for it."

You are beaten; remonstrance is useless, and you suc-

willing to pay for it."

You are beaten; remonstrance is useless, and you succumb.

"What else?" you ask.

"Nothin," lie says; "only my return pay, three days.

"Nothin," lie says; "only my return pay, three days.

"Nothin," lie says; "only my return pay, three days.

That's understood, of course. Three days, \$9, and expenses—dollar a day (that's reg'lar)—makes \$12. Sixtyseven, ten's seventy-seven, an' twelve's enghty-nine.

That's the bill—eighty-nine dollars."

There is no use in quarreling or remonstrating. While you were his partly, he took care of you as a father would care for an invalid son. When his time ran out, and you were off his hands, you became once his placer, his greenback mines, to be panned out and worked down to the ultimate dollar. You pay \$12, return money. He gets away at once, rows up to your late camp, lays in a day's supply of bread and ventson, makes his bed confortable for the night, and the next morning, at surnse, he starts for his return, for which you have paid him \$12. Now, how does he make it? I can tell you. He shoulders has boat and makes the carry to Twitchell Luke, seven miles; crosses that, and makes the carry to Big Moose Lake; crosses that, and makes the carry to Big Moose Lake; south, third, second and first, and by 0 'clock P.M. he is at the Forge House, whence he started with you two weeks before. He has taken \$1 2 of your money for return and expenses, and he has made it in one day, with-before he goes to bed. As for yourself, you sit down and count the cost about as follows:

Expenses from Lonville to Forge House.

1600

penses from Boonville to Forge House	7 50
y of guide	JU
rpenses from Wardweil's place, with according	в ш
niskey, eights, minkeys and omnived	_
Potvl	0 1

You have killed one deer, and caught many front. You have bad two weeks of delightful recreation. Trout and venison have cost you more than they would at Delmonico's; but they were fresher, and eaten with a far better appetite. As for the delicious air, the free, open air lite, the lakes, the scenery, the balsam-laden breezes, the sweet sleep at night, these cannot be estimated by money. "You pays your monty, and you takes your choice." I will only add, that the above

sketch is not a fancy one. It is all, substantially, fact, made out by actual, daily estimate, of the gentleman whose trip to the woods it outlines, and gives a rather favorable view of a successful tour for two weeks through the Northern Wilderness.

the Northern Wilderness.

The gentleman went home a week since, and the guide passed the camp where I write, three days ago, rather proud of his achievement in making the Ford House from Beaver River in one day. Let me quote from the melancholy Jacques in "As You Like It:" "A fool, a fool! As I do live by food. I met a fool i' the forest. Oh, noble fool, motley's the only wear." NESSMUK.

#### BALD-HEADED MEN BEWARE,

It is related of one of the South African crows—a large species of rook, with a white spot on his breast—that he will fly up in the air with a stone in his claws and drop it into a bird's nest to smash the eggs for food. Some naturalists have doubted this, but it is perfectly true, and ostrich eggs are frequently demolished in this way. Not only will this bird destroy eggs in this manner, but he obtains his livelihood chiefly by killing tortoises in the same way. The bird deliberately selects a stone, mounts high in the air with it in his claws, and poising over the tortoise a moment, with an accuracy of aim simply astonishing considering his great height, the circumstances of breeze, and there nowement of the saintal below, lets it drop. The fortoise, poor creature, goes along in his humble unobtrustive way, not meddling with anybody, when crack! and there is a great ghastly opening in the top of his shell. Down comes the ravenous rook, cleans all the meat out of the shell, and leaves it to dry in the sun. In some places these hollow shells may be counted in hundreds, E. B. B.

One can readily see how a stone might be dropped from even a great height with sufficient accuracy to strike among twenty or thirty large objects like ostrich eggs, lying close together, but it is hard to believe that a bird could take such exact aim as to strike a tortoise, which is scarcely larger than a single ostrich egg. If, in addition to the conditions stated, the tortoise should be moving. and a breeze blowing, the feat becomes still more astounding. It must be remembered that the crow men tioned is not a very large bird, and would probably be unable to rise with a large stone in its claws, and there fore to break the tough shell of a tortoise, the pebble must be dropped from a great height.

Our valued South African correspondent, while, as he tells us, he has never seen this particular feat performed. thoroughly believes in it, having been informed by reliable people that they had seen it done, and has seen hundreds of tortoise shells fractured as if in this way,

We may imagine that the young of the bird has to practice a good deal before it attains the accuracy required to kill its food, though it is fair to suppose that in accordance with certain now generally accepted laws of heredity the lesson is more easily learned by each suc ceeding generation of crows.

There is a story long current about a certain bald headed man who went into a menagerie, and after spending some time in examining and admiring the animals, feeling tired laid down in a retired corner and went to sleep. Presently the ostrich belonging to the show came along, and taking his bare and shining head for one of her own eggs, sat down upon it to the great embarrassment and annoyance of the bald-headed man. We should im igine that in South Africa, where the crows referred to by our correspondent abound, bald-headed men would be at a decided discount, unless they wore wigs or had their hats tied firmly on.

Our readers will remember the story of the venerable Greek philosopher who is said to have lost his life because a crow mistook his naked head for a stone and tried to break a quolog clam by dropping the latter on it Hec fabula docet.

#### THE LAMENT OF THE FRUIT GROWER.

NASHUA, N. H., Sept. 6th. Editor Forest and Stream :

Editor Forest and Stream:—

The season of birds is about over, and I beg you to allow me to give the results, as footed up by a fruit raiser. Like most of the good folks, we are the friends of birds. We have made them at home on our premises, protected them from cats and small boys, have offered them inducements in the shape of neat tenements, and have generally shown ourselves well disposed toward them. Like many of those to whom we show a kindness, they prove ungrateful, and I am now in favor of repealing the law which protects those which are the most mischievous and destructive, at least until they become less of a muisance than they now are.

First and foremost on the list stands cock robin, the red breast; he claims your protection to a certain extent, by

First and foremost on the liststands cock robin, the red breast; he claims your protection to a certain extent, by nesting in the hedge, in the bush beside your window, on the lowest limbs of the tree, in fact, just where the cat can most conveniently gobble the whole family, or the small boy steal the eggs. And how does the bloody-breasted villain repay us for the care we lavish on him. First by taking the best (and most) of our strawberries; we submit with good grace on account of the younglings in the nest. All the cherries go into his rapacous may; curants are too cheap and plenty for us to offer any objections to his taking his fill, but when raspb rries come and go, we plotest. Early pears ripen and the robins are on hand; they can't carry them off, so they just perchon

a twig and take a mouthful from this, then from that, until they have spoiled most of the fruit. Blueberry time comes, and you may expect a rest if you live in the country, but as soon as the early apples begin to ripen, "presto" our friends (9) are back as thick and hungry as ever, and as destructive. Early harvest and Porter apples seem to be just to their faste, and the layers and fairest country, but as soon as the early apples begin to ripen, "presto" our friends (?) are back as thick and hungry as ever, and as destructive. Early harvest and Porter apples seem to be just to their faste, and the largest and fairest fall to the ground partially devoured; we find no fault, for we have apples in abundance, and only wish that the robins would confine themselves to astrictly apple diet, to help us to dispose of the crop. But this is not enough. Our luscious golden apricot, which in this latitude requires more than ordinary care, and which is the crown jewel of our fruit garden, now attracts these ravenous rascals. My wife has succeeded, by dint of "shooing" and shoeing, in securing the best part of the crop. The contest has been a hot one, as the mass of empty cans, old shoes, firewood, etc., which lay about the tree attest. Peaches we have, and when the birds commence on them I swear (or hire a bad boy to do so for me), and take down the gun and make the feathers fly. Grapes are their particular fancy; cluster after cluster is destroyed, and the vineyard which has given such promise during the summer's now only an eye-sore, and a resort of our friend the robin.

But he is not along: the origin, or colden robin, has

But he is not alone; the oriole, or golden robin, has been his constant companion during the season, only he has branched out on his own hook, and made sad havoc with the green peas, picking open a pod and taking a pea or two, then opening another, and so on, kicking up a pretty mess (of peas). Still another, the much abused (? English sparrow, is as fond of grapes and is as big athlef as the other two. The catbird is, I think, the slyest thief, English sparrow, is as fond of grapes and is as big a thief as the other two. The cathird is, I think, the slyest thief, but I have never detected him destroying the larger fruits. The cedar bird, or cherry bird, is nearly as destructive as the robin, but he confines himself more to the smaller fruits. Robins eat grubs, insects and worms, to be sure, but it is in the early part of the season, before the fruit is ripe, and when they are obliged to. I like birds so well that if they would not come to me I would go to them, but I am beginning to think that perhaps we are having too much of a good thing; that we have protected them until they have increased so as to be a nuisance which must be absted. What is the remedy? Please don't say stuffed cat-skins, red rags, wind-mills, etc., etc., for we don't want to convert our fruit garden into a junk yard, and we have tried them all. The stuffed cat-skins were good, but there is a short market on cat-skins in this vicinity. Small boy and pot metal to the front, for a season, at least.

CAPTIVE CATS .- The following contribution to the Archives of Comparative Medicine and Surgery is from the pen of Mr. W. A. Conklin, and the observations are of so much interest that they deserve as wide a currency

as possible. Mr. Conklin says :as possible. Int. Commings some of the most val-uable and interesting animals to be found in the zoölog-ical gardens and menageries, their treatment in captivity is of great importance. It is impossible, in view of their confinement and consequently limited opportuni-ities of exercise, for them to have all the conditions of life favorephyla to health. Constitution is one of the zeites of exercise, for them to have all the conditions of life favorable to health. Constipation is one of the serious difficulties we have to contend with. To guard against this, liver is fed them once a week: when this proves ineffectual castor oil is administered with their meat. Their food is either beef or horse flesh, the latter being used altogether in the Zoölogical Garden of Philadelphia, and in the principal European gardens, as a measure of economy. Old and worn-out horses are taken to the gardens, where a veterinary surgeon examines them to ascertain if they are free from disease. In some gardens, the mode of killing these horses is by a blow on gardens, the modo of killing these horses is y a blow on the head, as the modo filling these horses is y a blow on Regularity as to time of feeding is of importance. We feed once on week days only, and fast on Sunday, in order to avoid surficiting and to give the stomach a rest. Regularity as to time of feeding is of importance. We feed once on week days only, and fast on Sunday is rodler to avoid surfeiting and group for the stomach a rest of the stomach are stored as the store of the st

at the menagerie suffer chiefly from rickets, which affects them when about six or eight months old. As a remedy for this we give lime, and have used calcis phosphorus precipitate with good result. We have a lioness at the park menagerie that has bred twenty-seven cubs in seven years, and raised but one. Mr. Bartlett, in a paper read before the London Zoślogical Society, savs: "A very extraordinary malformation or defect has frequently occurred among lions produced during the last twenty years in the Regent's Park. This imperfection consists in the roof of the mouth being opened; the palattal bones do not meet; the animal therefore, is unable to suck, and consequently dies. This abnormal condition has not been confined to any one pair of lions, but many lions that have bred in the garden, and not in any way related to each other, have from time to time produced these malformed young, the cause of which appears to me quite unaccountable."

THE BEAVER IN IOWA .- In a recent number of FOR-EST AND STREAM, "Nessmuk," in "Rough Notes from the Woods," states that "the beaver is the first wild animal of importance to disappear before the white man." This conclusion is directly opposed to the experience of an Iowa correspondent, who sent us an interesting note on the subject. It is to be hoped that the praiseworthy efforts of "E, B, B." to protect the beaver may continue to be successful. The few dollars that the skins might bring would be a very small matter compared with the interest which the town at large and all strangers visiting it, would feel in the presence of a colony of beavers living in the midst of a settlement. Our correspondent says :-

We have, within eighty rods of town, three beaver dams; two of them are within ten rods of the railroad dams; two of them are within ten rods of the railroad track. They have been there for about three years, and have been kept in good repair by the beaver family. The backwater is used by the boys in the winter for a skating pond, and in summer for a fishing pond. I never heard of but one being caught, and discourage the idea as much as possible.

A PARTRIBGE FLY.—Boomsboro, Sept. 10th.—Etitor Forest and Stream:—I send, inclosed, one of the Hippoboscidae, or partridge fly; at least I wish your judgment on the parasite, as I never saw one.

A few mornings ago, as I was returning from a squirel hunt, I observed a blue-tailed hawk looking after his usual breakfast of quail, flying low and searching the fields carefully. On flying near a cluster of young trees he was attacked by some crows. I thought at once that the crows would prove his destruction, and so hastened to slip into my gun a long-range shell, loaded and carried for such occasions.

for such occasions.

While the hawk tarried to fuss with the crows, I quickly made my way to a cluster of brush, a long shot from him, but the No. 4 brought him down. On going to pick him up, I found him standing up erect, wigs outspread and apparently ready for fight. While locking at him in admiration, as it was a beautiful specimen, large and full feathered, I observed something like a flash of light full feathered, I observed something like a flash of light come down from above, dart over the back of the bird, alight on the outspread feathers, and, by a side movement, disappear under them. I gave him a crack on the head and began at once a search tor the hidden object. I could find nothing on the back of the bird, but on turning it over and lifting the feathers of the breast, out it came and flew for my neck. I grabbed for it and fortunately caught it. It was hard to kill, seened tough and very tenacious of life. This is the only one that has ever been observed in this locality.

The specimen sent is a partridge fly (Olfersta americana). As we have stated before, they are frequently found on hawks, herous, ruffed grouse, quail, etc. They are, however, so quick in their movements and usually keep themselves so well hidden among the feathers that they are not often seen, unless they are specially looked for.

#### ABOUT THE EUROPEAN CUCKOO.

HE method by which the female cuckoo (Cuculus canorus) managed to introduce her egg into the nest of the small birds, to which the duty of rearing the nursling is entrusted, was for a long time very doubtful, and the question was debated at great length among The first hint as to the solution of the probnaturalists. lem was accidently made by Le Vaillant, who discovered on opening the mouth of a female cuckoo, which he had killed, an egg lying within the throat. A correspondent of the Leisure Hour, in a recent contribution to that magazine, gives the details of some observations made some years ago, which confirm the conclusions drawn from Le Vaillant's discovery, and which are in themselves very interesting. He says :-

arawn from Le Vaillant's discovery, and which are in themselves very interesting. He says:—

The fellowing occurrence, which I witnessed, will explain how at I sastone cuckoo's egg was conveyed to the nest: In the month of June, 1867. I spent a few weeks at Farmham Royal, Buckinghamshire. Farmham Royal, which lies about four miles from Windsor, at that time-consisted of a few scattered cottages, in the near vicinity of the well-known Burnham Beeches, and between the Beeches and the picturesque handle (by the way a favorite haunt of landscape painters) lies a stretch of strubly, healty common, through which several paths lead in different directions.

Sauntering along the edge of the common one bright sunny morning I stepped saide to have a look at a stone-chat's nest which I had discovered three days previously, when it contained but one egg. This nest was placed in a thick plant of heath, about ten or twelve inches from the ground, well concaded by the heather, except one little open space through which the bird passed to and from her nest, and through this open space through which the hird passed to and from her nest, and I observed that four eggs were deposited. Two cuckoos were llying about in a most peculiar manner and one of them uttering peculiar sounds. Both of them seemed to be in a wild state of excitement, and my first impression was that they might have a young bird in some nest near by and that danger threatened if in the shape of a stoal, weased or prowling cat, but cautiously approaching nearer them, I found that they were being mobbed by the two little stonechals. Sometime-both cuckoos would skim rapidly close by the nest, the stonechats darting at them open-beaked, and uttering piteous cries the while; again they would fly off rapidly to the edge of a wood at a little distance, pursued by the male stonechat, the female always hovering near her nest and occasionally alighting on a bush close to it. Could it be possible that the cuckoos, the one which I took to be the male (on account of the slig

Year the contained the four stonechat eggs and no more. Presently back can the cuckoos, the one which I took to be the male (on account of the slightly richer color of the plumage) "ouckooing" in a wonderful manner, uttering the note much more rapidly than is usual, and the female swooped down very close to the nest, paused for a moment in her flight, and being vigorously attacked by the stonechats, glided past, but I saw that her bill was partially open, as though she carried something within her gape. Evidently her object was to reach the nest, and it was truly marvelous to behold the determination and courage of the two little mites of birds in their efforts to prevent her reaching it. It would be difficult to describe in mere words the wonderfully graceful action of both male birds during their aerial encounters, and indeed the flight of the cuckoo at times much resembled that of a small falcon.

both male birds during their aerial encounters, and indeed the flight of the cuckoo at times much resembled that of a small fatcon.

It was about half past 10 o'clock when I had first come on the scene of action, and I watched till the forenoon was well nigh past. I was meditating on the expediency of scaring the cuckoo away, when the female flew up quietly and came down on the ground very near the nest, but on the farther side of the heather clump in which it was placed. At the same time the male cuckoo made a hasty swoop toward the nest, was driven off by the stonechats, and while they were thus engaged the female cuckoo, with rapid action, darted forward, alighted on the heather, thrust her head and neck through the small opening into the nest, in an instant withdrew and soared aloft, uttering for the first time a cry—not 'Cuckoo!' cuckoo!' but a gurgling, water-bubble kind of note. Her mate immediately joined her, and the two soared away to the wood, he joining in the shout of triumph with fond "Cuckoo." In a few moments I had run forward to the nest, and behold! lying beside the four pretty little stonechats' eggs was a beautifully marked cuckoo's egg, still wet with the saliva of the mother bird.

The stonechats reared their young in peace and safety, but that cuckoo's erg lies before me as I write, and the

bird.
The stonechats reared their young in peace and safety,
but that cuckoo's egg lies before me as I write, and the
sight of it recalls one of the most interesting episodes I ever met in bird life.

F IOWA LAKES.—Capt. J. K. Powers, Register of the State Land Office, gives the size of the Iowa lakes as taken from the office plats:—

Spirit Lake covers.
East Okubrij Lake covers.
West Ukobroji Lake covers.
Clear Lake covers.
Spirit Lake has a slore line of

MARKED SALMON.—There are many instances of marked fishes, and especially of salmon, being caught, but for singularity in marking we think the following, which has been going the rounds of the English press, is fully equal to anything which we remember to have seen. It is headed "Marked salmon at Berriedale, Caithness," and relates that recently the salmon fishers at Berriedale found in one of the bag nets, among other fish, a fourteen pound salmon bearing the following marks: On the flat, smooth part of the head, behind the eye, and immediately over the gills, a branded mark comprising the letters BB, FLU (the last mark appearing hise an apostrophe). A line was drawn around these letters in the form of a square border. Immediately under this was a mark which rudely resembled the outline of a salmon's head, filled with dots and streaks.

# Mish Culture.

DOCTOR GARLICK'S BOOK.

WE have just received the second edition of Dr Garlick's work on fish culture and angling". handsome octavo of 128 pages, illustrated with cuts of manipulating a spawning fish, ponds and a series representing the development of the embryo from impregna tion to hatching, printed in clear type on excellent paper.

Our fish cultural readers who are conversant with the art from its infancy know the venerable Doctor as the original American fish culturist, now in his seventy-fifth year, who has been infirm in all but his mind for years. and will welcome his new edition as an addition to our fish cultural literature, the first edition (published in 1857 being now out of the market. It is very interesting to read of the early trials of the Doctor and his friend, Prof. H. A. Ackley in 1853, twenty-seven years ago, stimulated by the success of Remy and Gehin in France, and by the translation of W. H. Fry, of what had been done in the Vosges. The first attempt was naturally made with the brook trout, happening on the 21st of November, and was a success, and the delight of the experimenters may be imagined when they placed some of the eggs under a microscope on the 9th of January and found them to contain embryos far advanced.

Figures of different modes of hatching on a small scale are given, and one (page 28) of an arrangement whereby a cheap experimental hatchery can be arranged in a house or office. Being mainly a reprint of his older work, the Doctor cites instances of hatching and transporting eggs and fry, as done in France in that elder day before the great work was begun here by the Government and State Commissions, as well as our private fish culturists, but in the new chapters which have been added he has a good word to say for the plebeian cattish, and also for the German carp, introduced by the United States Fish Com-mission, devoting a chapter to the latter, which he concludes by saying: "I will close this chapter on the carp by saying that from a careful perusal of Prof. Baird's Fishery Reports, I am entirely satisfied that I may say of this fish as Horace Greeley said of Concord grapes-it is the fish for the million."

The angling portion of the book gives no notice of the black bass, white bass, and other fresh water favorites, and in conclusion he says under date of Bedford, Ohio, Aug. 10th, 1877: "In concluding the second edition, I will only add, that since publishing the first edition of this work, I have lived to see my hopes in relation to fish culture nearly, if not quite, realized. I am now over seventy-two years of age, and probably this is the last that I shall ever have to say to the public on this subject. I have spent much valuable time, and some thousands of dollars to promote this branch of industries. If I have in any way promoted the object, I am satisfied, as I never wished nor hoped for any pecuniary reward."

#### HOW THE FIRST SHAD WERE HATCHED

ROCHESTER, Sept. 6th.

Editor Forest and Stream :

Editor Forest and Stream:—
In your issue of Aug. 26th I notice a communication from a correspondent on "Shad Hatching and Shad Laws." There are a few points on which he has been misinformed in connection with my early experience in shad hatching which I wish to correct. He states as follows: "Mr. Seth Green was employed, I believe, by both National and State authority to make the experiment. After exhausting his fund of experience and other knowledge in connection with the experiment, Mr. Green made a failure of the attempt, and packed his boxes, intending to return home next day. In the meantime an old shad fisherman, well known at the falls, besought Mr. Green to let him make a trial. The boxes were unpacked, and the fisherman placed them in a tributary of the river and the experiment was an immediate success. I believe Mr. the insertinal placed them in a triodiary of the river and the experiment was an immediate success. I believe Mr. Green received the credit. The locally accepted reasons for Mr. Green's failure and the fisherman's access were that Mr. Green's experiment was made in the warm water of the river, which was very low at the time, while the fisherman's experiment was made in the cooler water of the tributar."

of the river, which was very low at the time, while the fisherman's experiment was made in the cooler water of the tributary.

The facts of the case are that I went to South Hadley Falls at the solicitation of the New England Fish Commissioners and at my own expense, with the understanding that I should be remunerated if I made a success, and if I did not they were to hear no more from me. As is well known I did make a success, but the New England States never paid me within §15.540 fm ya ctual expenses, to say nothing of my loss of time, and it is admitted that my discoveries have been and are worth many thousands to them annually.

In regard to the old fisherman, of whom I have never before heard, making the success, your correspondent is mistaken. All any of the fishermen ever did for me while I was experimenting was to destroy my experiments, break my boxes, hoot at me, and, in fact, did everything they could to discourage and drive me away, and when I hit upon a plan which I felt sure would, and which did prove a success, I was obliged to watch it day and night to protect it from the ravages of the fishermen.

In regard to the stream mentioned, I tried the experi-ment of hatching shad in it, but was unsuccessful, the change of temperature being too great from the river water, and the only shad that were hatched successfully were hatched in the river and nobin the stream. I should

were hatched in the river and not in the stream. I should be pleased to learn the name and address of the old fisherman, and hope I may be favored with it.

Your correspondent is right in regard to the place for hatching shad. It should be done in the upper waters. I do not think that any attempts to hatch them at the mouths of rivers will ever prove a success. There should be a close time of two days in each week to allow the shad to get up to their spawning grounds.

The fishing could not be equalized in the way mentioned, as the lower river fishermen care about through when the unper river fishermen commence. The fisher

when the upper river fishermen commence. The fisher men at the mouth will always catch the most, because they have the first chance, and the upper river fisher men can only expect to catch those which escape their SETH GREEN.

### MR. THOMPSON'S TROUT PONDS ON LONG ISLAND.

HE Brooklyn Eagle gives the following account of

MR. THOMPSON'S TROUT PONDS ON LONG ISLAND,

The Brooklyn Eagle gives the following account of
the trout preserves and ponds on the Island:—
On the list of September the trout season of 1880 on
Long Island ended, and until March, 1881, the speckled
beauties of the lake and stream are to be left undisturbed
in their cool retreats, while the anglers will enjoy relating their expeciences of the past season, and the trout
breeders will begin to prepare for their approaching
hatching season of the year. And just here comes in the
query, "Have you ever visited a trout-breeder's fish
farm?" If you have not, do so before the cold weather
sets in, and you will see something worth a day's journey
to witness. Of all fresh water fish, trout are the gamiest,
pluckiest and finest fish that swim. They are the delight of the angler, as they give him the greatest sport
he has with his rod and line. Then, too, they nake the
delight of the angler, as they give him the greatest sport
he has with his rod and line. Then, too, they nake the
delight of the angler, as they give him the greatest sport
he has with his rod and line. Then, too, they nake the
daintiest dish of fish that can be set upon the table.
Hence, trout are in great demand, alike by the angler
and the epicure.

Long Island abounds in trout. The Island lakelets,
ponds and running streams have been the resort and
the home of trout since time unknown. Of late years
trout breeding has become quite an important occupation on Long Island, and now the culture of trout,
from the ovum to the full grown fish, is carried on to
quite a considerable extent, from one sad of the Island
to the other, beginning with Furnan's Trout Breeding
Establishment, at Newtown, and ending with Thompson's model trout farm at Noyae, near Sag Harbor.
The business is carried on very successfully, and the
result is the growth of thousands of fish not only
suited to replenish exhausted streams or to supply private trout ponds, but to answer the great market demand for Long Island trout, which

water" from the constantly running streams in which the trout revel and delight. In fact, Mr. Thompson, with rare taste for gardening, has made the place a perfect picture"

Let us examine a little into the details of the various processes employed in raising young trout, from the germ, to the full grown fish. We will suppose the trout spawn to be placed in the nest assigned for it in the hatching house, and that the embryo fish have been developed from the egg to the young fish, swimming about with its sac of food attached to it, on which it lives for a time, looking somewhat like a young tadpole, though not so fully developed, in each nest at the long row in the trough of the hatching houses at the farm there are from two to three thousand trout, all alive and swimming about in a running stream of cold spring water, one inch in depth, which ripples over a white sandy bottom. From the time the trout spiwns to the period the trout begins to look out for itself lorty-five days elapse. In the interim the young fish is fed from its yolk sac, which is, during this time, a part of itself. When this is removed by its falling from the body of the fish—at this time not more than half an inch in length—the young trout begin to work for their livelihood, and to earn it from the water. By this time they have grown to about three quarters of an inch in length. These youngsters are very tenacious of life. They have been known to have survived in a deep well for over a year without other food than the well water alone supplied. Trout are a very voracious fish, and even in early trouthood develop cannibalistic propensities, large trout living upon small trout, while parent fish will frequently devour their offspring, the male trout having quite a fancy for the young fish the young trout under the incentive of the process of regular feeding on a fish the incentive of the process of regular feeding on a fish

farm, would, "like weeds, grow apace;" but the young rascals take their time, and plenty of it, in growing to years of discretion; yearling trout range only from two and a half to four inches in longth, and it is three years before they reach the size suitable for the angler's purpose. All this time constant care in feeding, watching and caring for them generally is necessary, and, consequently, time becomes so much money to the trout breeder, as much so as it is to the city merchant. Hence, the breeder's stock of fish becomes expensive to him in proportion to each year's growth. Seventy-five days of time for the fish to enter upon the period when it looks out for itself in the watery world, and then a year's growth added before it reaches a length of five inches, shows very plainly how time enters into the costliness of trout breeding. From the rearing boxes the young yearling trout are let into the little lakelets of the farm, and there are collected according to their age. From these in time they go to the larger ponds or reservoirs, where they are held for use as occasion may require.

CARP GROW RAPIDLY IN FLORIDA.—Rizyford, Fla. Aug. 5th.—Prof. Baird:—Dear Sir: It will doubtless be a pleasure to you to learn that the carp you furnished me with last November are doing finely. I ascertained on my return from Savannah with them, that my pond was not ready for their reception, owing to the fact that there not ready for their reception, owing to the fact that ther were many more black bass in it than I had supposed I accordingly confined the carp in a pen at the side of the pond, giving them water through holes in the side covered. nond, giving them water through holes in the side covered with wire netting. A few weeks since I discovered that a portion of the netting had been misplaced and some of them escaped into the pond, and I then concluded to let them all into it, as I had nearly all the bass out. Their growth since that time has been simply marvelous. Many of them are ten or eleven inches long, and I feel certain they will spawn this fall. Will it be too much trouble for you to acquaint me with their habits? Do they bed; like some other varieties when they spawn? I will add that they seem quite tume and come to the place where I feed them as quickly as a drove of pigs would come for corn, whenever they find I am there. I am confident they will prove a great addition to the food fish of the South, and I shall take pleasure in distributing them as soon as they propagate. Very truly, yours.

Mr. Rixford also writes us as follows:—

Mr. Rixford also writes us as follows :-

It may interest some of your readers to learn that the German carp are thriving splendidly in our waters. Last November I received a lot from Prof. Baird, which I think were then from three to four inches in length. They are now from ten to twelve inches, and appear to make a visible growth from day to day. It limk they are the greatest addition to our food fishes that has ever been made.

Salvon Culture in Maine.—We learn that there are four hundred fine breeding salmon in the breeding pens of the United States Fish Commission at Bucksport, Maine, which is under the care of Mr. Charles G. Atkins. They are the so-called Penobseot salmon, S. salar, and are said to be in fine condition for yielding a fair crop

#### HABITS OF AN OREGON SUCKER.

ASTORIA, OREGON, July 6th.

ASTORIA. OREGON, July 6th.

ASTORIA. OREGON, July 6th.
a very curious fish found in these waters 1 send
the following, being the substance of a report made to
the U. S. Fish Commission, at whose request I was observing its habits and collecting specimens. The fish in
question has a length of eight to ten inches, is of rather
slender form, has a long and pointed head, large eyes,
large scales, and deeply forked tail. Its mouth, when
shut, is small, less than a half inch in length, but when
owen the lios project, forming a round sucker-like mouth, nargo scates, and deeply forked tail. Its mouth, when shut, is small, less than a half inch in length, but when open the lips project, forming a round sucker-like mouth, bent slightly downward. Its color is a dark lrown on the back, with the under parts of a pearly white; the sides are striped with black and pale silvery yellow, with a single narrow stripe of bright orange running from the lips to tail. A line of orange also runs around the edges of the gill covers. Altogether, there is nothing very strange in its appearance, and economically it has no value. It is not known whether it comes from the sea or from the muddy sloughs of the tide lands at the mouth of the Columbia River, though the latter is thought to be the case. It comes into the trout streams early in July for the purpose of spawning, seldom going more than a half mile above tidewater, and its visit is limited to two weeks in duration. I do not know its scientific name, and it is quite possible that it has nover received one. Locally, it is known as the "sucker." I had found

a few in a visit made a week previons to the one of which an account is given. They were found on this trip on the south fork of the Klaskani, a quarter of a mile higher than a week ago. The first intination I had of their presence was the sight of several dead and partially eaten fish on the botton of the stream, the work, doubtless, of some hungry mink or otter; then at some distance above I saw them leaping from a large pool, so many of them that there would be a dozen in the air all the time. The pool was about thirty feet by twelve, and in the middle five or six feet deep, its upper end terminating in a long ripple; across it, near the middle, lay, just level with the surface of the water, an old grass-grown log. Walking on this to where I could look down into the water, I saw such a sight as I had never seen before. I will not say that the pool was solid fall of suckers, for that would be more than the truth. To say that there was a half a few in a visit made a week previons to the one of which say that the pot he was shall that of suckers, for that would be more than the truth. To say that there was a half dozen for every cubic foot of water in the pool would probably be less than the truth. Making my way to the head of the ripple I batted my hook and allowed the current to drift it under the log. It was taken instantly. nead of the ripple I stated my hook and allowed the current to drift it under the log. It was taken instantly, and with a rush and vim that I knew a ten inch sucker was incapable of, and after the usual context I had the pleasure of landing a fine salmon tront (Salmo clarki), upwards of a foot in length. Looking now to the opposite side of the ripple, where the water was shallow, I saw site side of the ripple, where the water was shallow, I saw a mass of suckers entirely covering a space of six or eight square yards. Dropping the hook among them, after a few minutes I succeeded in catching one, and so ontinued until I had taken a dozen, when finding this method too slow, I allowed the hook to sink among them, when, by giving a sharp twitch, I would generally succeed in hooking one in the body. In this way I got some forty or fifty, as many as I thought would be wanted for specimens.

specimens.

I now started up stream, intending to spend the rest of the day in trout fishing, but found I was not so near done with the suckers as I had thought. They had preëupted the stream for a quarter of a mile. In one place, where the water spreads out forming a large shallow basin with eravely sides and bottom, they had collected on one side in a mass ten yards by one or two broad, piled upon each other so that at least one-fourth were out of the water—entirely out—a solid sometime, we water—entirely out—a solid sometime, we water the control of the water—entirely out—a solid sometime, we water the control of the water—entirely out—a solid sometime. each other so that at least one-fourth were out of the water—entirely out—a solid, equirming, quivering mass of fishes. Stepping down beside them, I began with both hands to throw them upon the bank, and had I wished I could have thrown out bushels. In the quarter of a mile that they had possession of the stream I saw several such that they may possession of the stream I saw several such masses, and supposed that they were crowding above the water to receive better the heat of the sun, which now shone bright, but found on my return at 4 o'clock, when the sun was below the tree tops and the air quite cold, that even more of them were in this position.

I found one place where the presence of several partly eaten fishes showed that even an other had failed to drive

them away. I am informed that large numbers of these fishes—less than half of the season's run, but a great many—crowd themselves ashore after spawning and die there, and I have no doubt these were performing the last act of their tragedy; the only instance, so far as I know of suicide among fishes

has act of their tragedy; the only instance, so far as I know, of suicide among fishes.

It must not be supposed that these fishes were sick or weak, or in any way incapable of continuing the struggle for existence. On the contrary, they were plump and strong, and apparently as capable of supporting the ills of their existence as any of their relatives in the deeper waters.

vaters.
It is a singular fact that so many of the fishes of this coast should die immediately after spawning. The smelt fosmerus pacificus) and the quinnat salmon are cases in coint. The fact in the case of the salmon can be accounted point. The fact in the case of the salmon can be accounted for by natural causes. The immense distance he has to go to reach the headwaters of the Snake and Columbia, the hardships of many kinds he must undergo, and all without food, for the oncorlepuchi do not feed in fresh water, must tell fearfully upon his vitality. But the smelt goes scarcely a hundred miles inland, and the sucker dies not half a mile from tidewater and twenty from the ocean.

C. J. SMITH.

#### THE GAME FISH OF TEXAS.

Editor Forest and Streum:—
In your issue of July 19th I notice a communication from "Bexar," of Corpus Christi, on the game fish of Texas. "Bexar," of Corpus Christi, on the Back spish of Texas. "Bexar" is correct as to the black bass, croppie and wide-mouthed perch, all of which are very abundant in Texas waters, but whether the rock bass is an inlubitant of that State I cannot say. It has been taken in Louisiana, but I know of no instance of its being found so far Southwest as Texas. There are two species of Pomorys, both called "croppie" or "crappie" in certain sections, but I think but one species (P. annularis) exists in Texas. I will give brief descriptions of these several species for the information of any who may be in doubt as to the identity of any or all of them.

LARGE-MOTHED BLACK BASS.—M. pallidus (Raf.).

LARGE-MOUTHED BLACK BASS.—M. pallidus (Raf.), Gill & Jordan. This is, as all know, the so-called "trout" of Southern waters. It is the game fish par excellence of the Southwest, and a further description at this time is unnecessary.

WAR-MOUTH PERCH.—Cheenobryttus gulosus (C. & V.) W.A.-MOUTH PERCH.—Cheenobrythus gulosus (C. & V.). Gill. This is the fish alluded to by "Bexar" as the "wide-mouth perch," and which is a very good name for it, the etymology of its generic name being channo, to yawn or gape; bruttos, sunfish, and its specific name, yulosus, big-mouthed; literally, "wide-mouthed gaping sunfish." It has a mouth very similar to the black buss, and also closely resembles that fish in the radial formulæ of its fins. It has a robust body, depth about half of length; broad forward, compressed behind; nape rounded; a depression over the eye; the snout projecting, forming an angle; fins rather low, with stout spines; teeth on jaws, tongue and palate; scales large. The opercular spot on flap at the end of gill cover is as large as the eye, black, bordered with copper color. There is another space. spot on Hap at the end of gill cover is as large as the eye, black, bordered with copper color. There is another species of Chambby gitas in the South Atlantic States (C. viridis), somewhat smaller and slenderer, and is likewise called "war mouth," also "bream."

CALICO BASS.—Paragram.

CALICO BASS.—Pomozys nigromaculatus (L. S.), Girard. This fish is also known in various sections as "grass bas," "silver bass," "stawherry porch," "gorgle-eyed perch," "razor-back," "croppie," "chinkapin perch," etc., all of which are more or less expressive, though I think the latter the most distinctive and ex-

pressive of its specific name (black spotted), provided what a chinkapin" w

every one knew what a "chinkapin" was.

Body nearly oval, half as deep as long much compressed, arched, thin both at the back and belly; snout projecting, forming an angle; mouth moderately large, but smaller and tougher than the next species (P. annularis); fins very large, annal fin larger than dorsal. Black-ish, or bluish green on back; sides and helly silvery; marked with dusky blotches, as if made with the ends of one's flugers.

of one's fingers.

CRAPPIL.—Pomoxys anniharis (Raf.). Also known as "backelor perch," new light," "Campbellite," "finmouth," "silver perch," "speckled perch," etc. It is very similar to the last-named species, though is sexucely so robust, and not so deep than a larger mouth, which is quite thin, white and transparent, hence the name "timouth!" it is more silvery, or white, in appearance, and the day are not so, variewised as in the other semier, and the fins are not so variewised as in the other semier, and the fins

the dark spots on once and sides are smaller, and the ones are not so variezafed as in the other species.

This, I think, is the species so abundant in Texas. Both species are handsome fishes, though not very "gamy."

species are handsome fishes, though not very "gamy." Rock Bass.—Ambloptites rupestris (Raf.), Gill. A well-known species, very generally distributed west of the Alleghanies, and also known as "rad-eye" and "gog-gleeye." It is a good pan-fish and quife "gamy." Body thicker, or more robust than the "cooppies." though not so much so as the "war-mouth." Depth about half of length; head and mouth large; eve very large, iris red; front, or face, convex; color, brassy-citive, with golden green and dusky markings; a dark spot at base of each senlo, giving a somewhat fainfly striped appearance, which is more conspicuous after death. Dorsal fin larger than anal.

more conspicuous after death. Dorsal fin larger than anal.

The above-named species all belong to the family Centrarchide, which is composed of percoid fishes with a single dorsal fin, either continuous or deeply divided, with from three to nine spines; ventral fins thoracic, with from three to nine spines; ventral fins thoracic, with one spine; body oblong, more or less elevated, and sometimes much compressed; some with a more or less prolonged flap at the end of gill-cover (onercle), and nearly all with a black spot, larger or smaller, at this point; mouth oblique; villiform, or velved-like teeth on ignes, come and palate; teeth on tongue, present in some, but absent in other genera.

The "war-mouth" is especially distinguished by its large mouth and robust appearance; and the "croppies" by the very large anal flus, being larger than the dorsal.

As the species above described are readily distinguished by the number of spines and rays in the dorsal and anal fins. I submit the following formula, with the remark that all of the spines must be counted, no matter how short or rudimentary the first ones may be, and that where the last soft ray is branched or forked it is to be counted only as one. The number of spines and rays may very energy or two in different beselfilies, thus is the counted only as one.

where the list soft ray is oranched or forked it is to be counted only as one. The number of spines and rays may vary one or two in different localities; thus, in the extreme South or Southwest the number of spines in the dorsal fin of the black bass may be often found to be nine, or even eight, instead of ten. In the table the spines are indicated by Roman numerals and the soft rays by Arabic numerals; thus, X, 12, means ten spines and twelve soft rays. twelve soft rays.

Species. Dorsal. Black bass (M. patlidus), X, 12, XI, 11, X, 10, VII, 15, VII, 15, III, 10. VI, 10, III, 9, VI, 18, VI, 17,

Black bass (M. pallidus), X, 12, III, 10, Rock bass (A. rupestris), XI, 11, VI, 10, War-mouth (C. gulosus), X, 10, III, 9, Calico bass (P. nugromaculatus), VII, 15, VI, 17, (Cappie (P. annularis), VII, 15, VI, 17, "Bexar" seems to be in doubt as to the use of the name "goggle-eye." It is a poor name a thest, and is applied to several different species. He states that "Hallock's Gazetteer" gives rock bass, croppie and goggle eye to the same fish, which is unfortunately the case on page 323; but this is an error. It is almost impossible to compile a work of the character and extent of this without some errors creeping in.

some errors creeping in.

In the instance referred to it was no doubt the intention of the compiler to include both the rock bass and the crappie among the "Fishes of the West," but somehow got them nixed. If "Bexar" will crase entirely the paragraph referred to, and write, in the margin, "rock bass, page 273; erappie, page 378; "mod then refer to the former page and add to the rock bass its present technical name Amblophites rupestris (Raf.) Gill, and then turn to page 378, and add the name Pamorys nipromaculatins (L. S.) Girard (its present name) to the description of the croppie at the top of the page, he will have it correct—though this "croppie" is the calico bass. At the bottom of the page (378) the other croppie is described as "sand perch" and "tin mouth." On this same page he will also find his "wide-mouth perch" referred to under the name of "maw-mouth," or "goggle-eye."

name of "maw-mouth," or "gorgle-eye."

Withe "Bexar" is about it, let him erase Roccus chrysops (on page 379), for it has nothing to do with "smifish;" but, turning to page 273, add it to the "white lake
bass," for it is the present name of that fish,

J. A. HENSHALL. Cynthiana, Ky., Aug. 27th.

The Basses of Tennesspe.—Savannah. Tenn., Ang., 30th.—I have just returned from a short fishing excursion to a stream some six miles away. Notwithstanding the low water and hot weather, we had fair sport, taking some game bass and perch, the largest, a bass, weighing three pounds. The mode of angling, most killing in the present state of the water and weather, is to fish on the bottom with live minnows, trying the swift water early and late, and resorting to the blue holes during the hot hours of the day. One can do no good in these streams by casting, either with minnow or fly. We have here three varieties of bass, M. salmoules. M. pullidus, and a striped bass, yet our local angiers who distinguish fish by their color alone, make many more kinds. The two varieties M. salmoides, and M. pullidus are known as "black trout," or "green trout," "pond trout," white trout," or "chab trout." The "black of green trout," white trout, "or "chab trout." The "black to green trout," white trout, "or "chab trout." The "black to green trout," outminber the offier varieties, and is more highly esteemed. In addition to the other fishes named, we have here the rock bass, known in these waters as block perch. Soft they and M. salmoid. the other fishes named, we have here the rock bass, known in these waters as black perch. Both they and M. satuncides, show great diversity of color, some being very pade, while in the same "hole" you may take others of almost inky blackness. The pike-perch, in local parlame "salmon," were formerly abundant, but have recently become scarce, not a dozen having been taken this season. In

the "good old past" many large ones have been captured. the "good oid past many large ones nave been captured. The largest on record weighted seventeen pounds, and was ensaured by the president of the "Edaw Hammer Angling Association," the veteran angler of this portion of the State. The above mentioned "Klub" owes its name to the style of coat worn by its presiding officer on high day, and holidays. WILL.

#### THE REVISION OF THE SALMONIDA.

THIS work is progressing slowly but surely; is so interesting, and has been so long needed, that we hail with joy everything concerning it from our ichthyologists. It has been such a relief to have the formidable list of thirty or forty species, recorded in the olden works, boiled down to about half a dozen. That the work is not yet complete is true, but the labors of Bean and Jordan show that they are not idle, and there is no doubt that the tangle into which Suckley got the Pacific coast salmon will eventually be straightened out. Suckley's work was perhaps as good as could be done with the material at his command, much of which was in such a state that it is a question whether it would have been a loss to science if it was entirely lost. He describes species from dried skins, and from specimens partly destroyed by alcohol, as well as made new species of male and female, old and young, as they differed in their characters. His limited number of specimens must, however, be his apology, as he did not have the advantages of the splendid collection of the National Museum at his command. On the subject of these Western salmon Prof. Jordan writes us as follows :-

BLOOMINGTON, Ind., Sept. 6th.

Editor Forest and Streum:

BLOOMINGTON, Ind., Sept. 6th.

Editor Forest and Streum:

In reference to Dr. Bean's notes on the redfish in your paper of Sept. 2t, I have to say:

1. I have now no doubt that the "Idaho redfish," the "iddish" par excellence, is Oncorhynchus kennertyi. In my visit to Oregon and Washington I obtained consideral excitence which supports Dr. Bean's view of the case, which moreover is clinical by his positive examination of the specimens sent by Capl. Bendire.

2. It is probably true that the made of different species is also known as "redfish" in different localities, and of these "redfish," O. nerke is certainly sometimes one.

3. The determination of these species, made three years ago by Gil and Jorian, were based on very insufficient material; "the best we had," but still very poor. Since then, I have been able to examine them in their native waters, and my assistant, Mr. Charles H. Gilbert, is still attret them. We have thus far failed to find any evidence of the existence of more than five species of salmon on our Western coast, although we are ready to enlarge our notions if any more actually turn up.

These are the following:

1. O. ke-maerlyi (Suckley). The redfish known by its preming form, compressed and deep, the long compressed head, with the very large, oblique mouth. The voincaine teeth, as stated by Dr. B-an, are more than usually developed), fifteen. Back and tail, with black spots. Weight, usually less than five pounds. We know this to be Suckley's Salmo kenneryit, hence its specific name is probably fixed.

2. O gunnet (Richardson). The quinnat salmon, the largest and by far the most abundant and valuable species. Scales, 138-155. Branchiost gals, lifteen to intercen usually one more on one side than the other. Gill rakers about fourteen, below the angle about venty-four in all Pyloric coca, about 100. Anal rays, about sixteen. Back and tail, with black spots. Weight not seventy pounds.

We know this to be the original Salma quannat of R

ever changed.

3. O. tsuppitch (Richardson). The "hooped" salmon. 3. O. tsuppitch (Richardson). The "hooped" salmon. The smallest salmon yet known on our West coast. Scales. 12-130. Branchiostegals, thirteen to fourteen. Gall rakers, about thirteen below, twenty-three in all. Pybric cosea, about sixty-three. Anal rays, thirteen be lock, spotted; tail always plain, except the uppermost ray which is sometimes spotted. This species reaches a length of about eighteen inches, and a weight of four to five pounds. It is probably, but not certainly, the Samo Isappetch of Richardson, and its proper specific name is uncertain. There were no specimens of this species in the museum when our first studies of the oncorriynchi were made, and the name tsuppitch was adopted by Gill and Jordan for a different fish, which turns out to be the same as Salmo Clacki.

4. O. nerka (Walbaun). The blue back, or Fraser Rever salmon.

same us Salmo Cateria.
4. O. nerka (Walbaum). The blue back, or Fraser R.ver salmon.
This species is found from Oregon to Alaska (fide specimen from Aleutain Island). It runs in small numbers in the Columbia with the quanta salmon, and in much larger numbers further North. Scales, 130–135. Branchiostegals, thitteen to fifteen. Gil rakers, twenty-three below, thirty-live to forty in all. Pyloric cocoa seventy-five to one hundred. Anal rays, fourteen. Weight, cight to ten peunds. A remarkably graceful species, the back deep blue, and no black spots anywhere. This is certainly the Chroch-quelus Infeadon of Ginther, and probably the Salmo nerka of Walbaum. Its name cannot however be considered as definitely fixed.
5. O. gorlinscha (Walbaum). The hump-back salmon. Scales, 215–240. Branchiostegals, twelve. Gill rakers, twenty-eight. Anal rays, fourteen. Weight, six to eight pounds. There is little doubt that this is the Salmo gorlinscha of Walbaum, and if so, its present name is permanent.

FIFHING AT MARTHA'S VINEYARD.—Cottage City, Matha's Vineyard, Mass., Any, 16th.—Several of your subscribers have been sojoining here for a couple of weeks. Annong the number are Mr. J. J. McGere, and Mr. M. W. Emmons Jr., of your city. Maj. Gro. Gifford, of P-iladelphia, accompanied them on their fishing excrsio is during the past and present week, catching bluefish off Cape Force, receing twenty-seven one day, and that, for another, and snapping another. Capt. Cleveland and his handsome craft have been chartered for two weeks. The Island of Martha's

Vineyard now teems with human beings, and all with one accord pronounce the Vineyard fishing equal, if not superior to any on the coast of Massachusetts. The 28th of August our city of cottages was illuminated, and \$500 worth of fireworks were exploded. G. G. G.

STRIPED BASS IN THE PISCATAQUA.—Dover, N.H., Aug, 26th.—Within a short time quite a number of striped bass have been caught at Piscataqua Bridge, a place on the Piscataqua River, some five miles from here, and eight from the sea. On Wednesday last, Mr. Al. Clements succeeded in landing one that tipped the scales at forty-five pounds. He was brought to this city and placed on exhibition in one of our markets. Quite a little army of fishers are preparing to make a descent on the above named place, in hopes they may bring to the surface, if no further, some of these beauties of the deep.

W. A. G. STRIPED BASS IN THE PISCATAQUA. - Dover. N. II.

HABITS OF SALMON-THE USE OF THE HOOK,

WINDSOR, NOVA SCOTIA, Ang. 30th.

FOREST AND STREAM, just received, contains a
courteous note of inquiry from Mr. C. G. Atkins
respecting the use of the hook on the lower jaw of the
male salmon, also notes by "Stanstead," in which the
writer asserts that he has: "taken considerable mains to
get the opinions of many of the north shore fishermen
regarding some of the theories advanced by him (Find),
that salma me himmula survivors, and offen neuter rivers.

regarding some of the theories advanced by him (Hind), that salmon are biomial spowners, and often enterrivers for sanitary purposes, not for the purpose of spawning. The replies "Stanstead" appears to have received were not favorable according to the fisherman's views.

In your issue of the 19th you reproduce Mr. Mowat's interesting letter, in which he takes exception to the view I have advanced regarding the scarcity of salmon this year. Finally, a St. John, N. B., paper of the 16th August, contains a rhapsody from the pen of "Salmo Wilmotii," according to local contemporaries, in which I am rather roughly handled for venturing to doubt the efficacy of the work of "Salmo Wilmotii," as now carticled on.

nied on.

If you can allow me space I would like to glance at all

If you can allow me space! would like to gamee at all of these communications, begining with the last list.

The author of Salmo wilmotil begins by calling names. This is unscientific and suspicious, but as it appears to be an acquired local habit! let it pass. Referring to my letter to Prof. Baird, which you thought worthy of publication, this author says: "He (Hind) delivers himself of a united bairing a properties the reasons why the salmon lication, this author says: "He (Hind) delivers himself of a stupid opinion respecting thereasons why the saimon are backward this year in their navigation inhand," and in argument against my view the author of Suhno vidualiti urges the following luminous reason: "Everybudy will agree that last winter was not a severe winter." In reply, I say that I did not consult verybody, or anybody about the winter. I referred to the comprehensive series of meteorological observations classified in the War Department of the United States, under the supervision of the late Gen. Meyer. I supplemented my inquiries with a review of the meteorological observations classified at Toronto, under Prof. Kingston, and recently under Supt. Carpmael. I did not encumber my letter to Prof. Bard with a reference to these authorities, because I knew that he perfectly understood where and how I had obtained my meteorological information.

And here, before referring to any other subject, let me

And here, before referring to any other subject, let me linger for a moment to write a word in grateful respect to the memory of Gen. Meyer, as to one who has done much for humanity, and has left us in his prine. For four years, Gen. Meyer did me the honor to cause to be sent to me with unvarying regularity, the Monthly Weather Review, from the office of the chief signal officer, and this without any charge whatever. I was indebted to Prof. Baird, in the first instance, for this courtesy, who suggested it, and white I have pleasure in acknowledging my indebtedness to the one, it is fitting that I should record a respectful appreciation of the lifework of the other. Gen. Meyer instated and guided to marked success a scheme of cooperative observation, which will enroll his name among the benefactors of nankind. mankind.

I observe that Mr. Mowat states in the letter you have reprinted, "our weather here last full was not colder than usual." In answer to these generalizations, I submit the following observations taken from the authorities already named.

MEAN TEMPERATURE LOWER IN 1879 THAN THE CORRESPONDING

	October.	November.	December
Fredericton, N. B		2 53	6.80
St. John, N. B	2 51	3.48	5 40
Halitax, N. S	3. 15	2.30	1 93
Sydney, C. B. Is	5.10	5.20	£.35
MI	NIMUM TEMPER	RATURES.	
	October.	November.	December Below zero
	48 0	9.0	91 5

Fredericton, N. B. 17 3 St. John, N. B 25 0 Halifax, N. S. 23 4 Sydney, C. B. Is 27.

Hadifax, N. S. 23.4 13.7 2.4 2.5 2.4 2.5 2.4 2.5 2.6 2.6 Erom these observations it appears that, in all cases, the mean temperature of October. November and December, 1879, fell very considerably below the mean temperature of the corresponding months in 1878. In Gen, Meyer's comments on December, 1879, in relation to low temperature, he says; "The following notes are of interest, as indicating the excessive cold (sic) of the month in various sections," etc., etc., So much, then, for the "stupid opinion" which I gleaned from the results of very many independent observers, and which the author of Sulmo without has courage to contradict by quoting "everybody." Now, let me reply to "Stanstead," S. W., and Mr. Mowat, all in one, respecting the point that salmon enter rivers for sanitary purposes, and not necessarily for spawning, and enter different rivers to those in which they were born. "Stanstead" wants proof; the other gentlemen don't believe it.

Record of the experiments of the proprietors of the Brie River (Ireland), published in the official reports on

caught in the Erne, and marked with medal No. 20. Released, and subsequently found killed in the Lough-

caught in the Erne, and marked with medal No. 20. Re-leased, and subsequently found killed in the Loughhead River on the 28th November, 1876.

Here you have positive proof of identity, and of visiting a parent river to spawn, of leaving that river, and of being taken in a neighboring river some months afterward. What did these fish ascend the neighboring rivers for? It was not for spawning purposes—it was too early; and the rivers in which they were found were some miles distant from their native rivers. It was not for food, for the adult sea salmon does not feed in rivers.

Again, salmon are frequently reported by the watchful water-bailiffs in Ireland "about the mouths of rivers," waiting, it is supposed, for "a rise or freshet." They suddenly disappear, but not up the river; they go out to sea, or it may be to try other rivers. This is a constant observation.

#### SPRING SPAWNING SALMON.

SPRING SPAWNING SALMON.

Mr. Mowat incidentally acknowledges this habit, in describing the "spring kelts." I first saw the nests of spring spawning salmon on the 24th July, 1864, at the head waters of the northwest branch of the Southwest Miratnichi. I was at the time making a geological survey of New Brunswick for the government. My canoe men were both excellent salmon poachers, and spoke of the spring nests as by no means uncommon. The nests are made in March or April, eccording to the season. I examined two of the nests I saw. The eggs were there, transparent, and consequently alive. If they had been nests of the fall schools, the eggs would not be there alive; these would have hatched in May, or, if they had died, then decomposed by July.

I wanted to get a salmon, and said to my canoemen: "Catch me a salmon," "Tonight," was the reply. They constructed a negog, or Indian spear, making it out of a large mail, the tynes of birch. An hour after nightfall I had two sulmon and three grides, and could baye obtained five times that number, if I had been so disposed.

The bright salmon caught in the Moisie River, on the The bright salmon caught in the Moisie River, on the spawning grounds in October, are spoing spawners, coming up the river in the fall. Mr. Mowat's "spring kelts coming from the sea late in November, with the ova at the same stage as the June fish," are spring spawners. I have mentioned spring spawners in Newfoundland waters in my article on "Spring Spawners," published in Forest and Stream in January, 1880.

#### BIENNIAL SPAWNERS.

RIENNIAL SPAWNERS.

This habit, to which some gentlemen take exception, is perfectly well known in Europe. The London market in January is supplied from the biennial spawners which congregate in the rivers in Holland during the winter season, and which are known as fat winter salmon; also, from the fat tidal salmon caught, until 1878, on the 1st of January and suitesquently, in the Sligo District, in Ireland, and to a less extent in the Dublin District.

District.

The chief spawning season in the Sligo District is the last fortnight in December. The fish taken in the tidal waters the moment the close time vessed as midnight in the 31st of December, were fat biennial spawners or the finest quality." This salmon was camble by hundreds the moment the church bells in Sligo District

hundreds the monient the church bells in Sligo District announced the opening of the new year, up to 1878. Then the proprietors of the upper portions of the rivers exerted themselves to have the close time extended to the 15th of January, and now tidal salmon fishing begins there at midnight on the 15th.

In brief, the gentlemen who contend against the idea of biennial salmon spawners, should read, with care, Barforth's article on the food of the salmon, translated by Dr. Pheodore Gunther, and printed in Prof. Baird's Report for 1873 to 1873. They should read Dr. Frie's account of the Bohemian salmon. They should look beyond their own rivers, and see what the rest of the world has done and is doing. yond their own rivers, and world has done and is doing.

#### THE HOOK ON THE LOWER JAW OF THE MALE SALMON.

world has done and is doing.

THE HOOK ON THE LOWER JAW OF THE MALE SALMON.

It must not be supposed that the hook is a constant development on the full grown made. During his off seasons he does not develop a hook. During his spawning seasons his lower jaw alone protrudes and curves upwards. This is a very important fact in relation to the ladits of the salmon and its instincts. It is very wonderful, and opens a new and I believe an untrodlen field of inquiry in relation to the movements of many species of fish, particularly the anadromous species in connection with temperature and food supply. The principle it involves probably extends to various genera of the cold water lishes, and greatly affects their movements.

But, while during their barren seasons the old males are almost hookless, the young males, developing milt, always show the hook. I think that the old inades conserved to the proper the season of the book of the proper medical products of the salmoniste, the captin. As Jungemen at another of the salmoniste, the captin. As Jungemen at another of the salmoniste, the captin. As Jungemen at another of the salmoniste, the captin. As Jungemen at another of the salmoniste, the captin. As Jungemen at another of the salmoniste, the captin. As Jungemen at another of the salmoniste, the captin, wormale includes a female between them, the developed religes on their backs of the mole captin, running from head to tail. The french each, either tidal or submarine, to a depth of thirty fathoms, the one condition being that the beach must be gently sloping. The pressure of the two males, with the female between them, against the snudy beach conspected the the condition being that the beach must be gently sloping. The pressure of the two males, with the female between them, against the snudy beach conspected to this 1 am the proper the same mounent, and the trio complete the process, apparently in a single rush, but of this 1 am discharged at the same moment, and the trio complete discharged at the same moment, and the trio complete the process, apparently in a single rush, but of this 1 am n t sure. The ridges are absorbed subsequently, and the backs of the males become nearly smooth, like those of the females

received the first hint of the use of the hook on they were born. "Stanstead" wants proof; the other gentlemen don't believe it.

Record of the experiments of the proprietors of the Ereon River (Ireland), published in the official reports on the Irish Salmon Fisheries for 1875 and 1876. Oct, 19th, 1876: Male fish, caught in the Erne, weighing 19 bs. Red, that is, in spawning condition, marked with medal No. 15. This fish was captured by analing in the Bandrowes River on the 30th March, 1876, and weighed 12 bs.

Aug. 29th, 1876: Male fish, fresh, weighing 13 bs., and the standard of the Moisso River, where salmon in great numbers were crowded together, this half Indian, the salman spawning. As this occurs only at the object of the Moisso River, where salmon in great numbers were crowded together, this half Indian, the salman spawning. As this occurs only at the object of the Moisso River, where salmon in great numbers were crowded together, this half Indian, the salman spawning. As this occurs only at the creening, and princip in glo only rivers late in the afternoon, it is rarely that the observer has the onance

to see the male salmon make his charge and grip. I saw it to see the male salmon make his charge and grip. I saw it fairly once only, but had no idea of its object until I saw the caplin spawn in Trinity Bay, Newfoundland, in 1876, and afterward found dead male caplin on the Northern Labrador, with the ridges nearly gone from their backs. The explanation of the seizure of the female by the male dawned upon me when reading Barfurth's, Siebold's and Block's statements about the disappearance of the hook in the fat biennial spawning male, during his barren year.

and Block's statements about the disappearance of the hook in the fat biennial spawning male, during his barren year.

Now as to structure. If Mr. Atkins will refer to the same volume of the Commissioner of Fisheries Report, which contains his own excellent paper on "The Athantic Salmon," he will find, on page 719.4 translation of alecture on the organs of reproduction in fishes, etc.; and on page 721 he will see a diagrammatic illustration of the ovaries and oviduct of the majority of osseous fishes. I have searched in vain for anything like this structure in the anadromous salmon. I have utterly failed to discover even similarity in the anadromous salmon with the representation of the organs and their relation to the genital orifice. But I am not an anatomist, nor a physiologist, and should be sorry to find myself attempting to describe structural differences or affinities. This is the work of specialists nowadays. Were I to do so, I should probably discover Salmo vilmotii, No. 2, in five minutes, Hence my cautious statement, "I think you will find," etc., to which Mr. Atkins calls attention. But I long since found in the salmon (and have before me in alcohol at the present moment) a structure which led me to the conclusion that the eggs of the salmon were contained in closed sacs, separated from the oviduct by a membrane which serves the purpose of a hymen, and that it is the function of the hook on the lower jaw of the male fish to break this membrane when the proper hour arrives.

If Mr. Atkins calls are that it is the function of the hook on the lower, so as not to lossen the eggs from the lettless by hardling in a different medium, he will, I think, satisfy himself that the conclusion I have advanced is not hypothetical.

Your correspondents have touched upon one or two other points, which the space I have already occupied prevents me from noticing now. But with your permission I will advert to them in a future communication. Discussions on these subjects, if temperately conducted, must be productive of

#### A FISHING TRIP ON LAKE SUPERIOR.

A FISHING TRIP ON LAKE SUPERIOR.

DULUTH, Minn, Aug. 21st.

A BOUT three weeks ago a party of seven, including your correspondent, went down the north shore of Lake Superior, on a trout fishing trip. We had such good luck and such a pleasant time, that I thought your readers might like to hear of it.

The personnel of our party was, first and chiefly, the "Piegan," then the "Buffalo Bull," whom the Piegan was supposed to drive, next, a nameless gentleman, then the "Freshman," and last, three boys. We left Duluth in the wee small hours of the 5th of last month and rowed down the lake six miles to a small stream, where one of the party caught a fair sized trout; here we found a gridiron, and as our party were eminently respectable so, to speak, we captured it. After rowing about three miles further, a tug took us in tow and landed us at Sucker River, eighteen miles from the head of the lake. As we lay down on the ground with nothing over us but our blankets, we promised ourselves good sport on the morrow. Early the next morning, after a breakfast in which bread predominated, the whole party started off for the trout streams. We followed a deer trail for two weary hours, during which time all the party, with the exception of the Piegan and myself, turned back. We pushed on, and at noon were five miles from camp, with about fifty trout. After a dinner of two slices of water-soaked bread, we walked a mile and a half further up the brook and then fished down. At 730 we came into camp with 160 good trout and true. The rest of the party had twelve fish. After a good night's rest we sailed on to Encampment Beach, thirty-five miles from Duluth, where we intended to spend the Sabbath. We selected as beautiful apot as one often sees for our Sunday rest. Imagine a deep bay, with a sandy beach, perhaps thirry feet wide, running around it a distance of fully two miles, a rocky infer rising percipitously from the cold, sky-tinted water, as if in sharp contrast to the mainland, and crowned with foliage of the deepest green. Beh

gizing over its boundles expanse, the sun sank behind the hills easting a glory over the sea and sky that I never expect to see surpassed.

Early Monday morning we started on, but the northeast wind blowing very hard we made but tifteen miles, and campde that night at Split-rock River. The next morning we put out early, bound for "Baptism or bust." At mon we rowed into B-aver Bry, a town of about one hundred people, and where we replenished our conmissary depurtment, which was running low. While there we met a party of three, fresh from Baptism, who informed us very coolly that they "didu't think we would catch many there, they'd just taken out a hundred pounds." This rather knocked our calculations in a heap, but we went on and reached our Meca at 4 o'clock, in time for the evening fish. The "lone fisherman" went up the river ab ut a mile, to the falls, and got only some dozen fish. He came back quite discouraged with the outlook. The next morning all the party but one went up the stream and brought down at noon about thirty fish, weighing on an average three-quarters of a pound each. They reported seeing a monster trout laying under a stone up the river, and so in the afternoon the boss fisherman and myself went after him. We saw him under the stone and grappled for him, hooked him, and pulled; he did not come, so I waded into the water for him and got hold of the line, which was a quadruple strand, made especially for the occ usion, and slowly but surely pulled him and. As so make the day, and we put on our means, but the right won the day, and we put on our means, but the right won the day, and we put on our

string a speckled front that beat anything I ever saw; he was twenty-one and a half inches over all, five inches deep two and a half inches in thickness and weighed when dressed four and a half pounds. Talk about your brook trout that weigh about a pound or two! You should have seen us after we had got him! My companion in arms made some remarks about the "Great horned spoon." I spoke of the "Devil trace river," and we made the woods resound. That was our gala day. Our bill of fare, too, on that day was style. Here it is: Breakfast: fried trout, flapjacks, coffee and bread and butter, etc. Dinner: flapjacks, coffee, fried trout, bean soup, crackers, etc. Supper: fried trout, baked trout, coffee, etc. That night we slept the sleep of the just, as it were.

About 4 o'clock the next morning one of the party went up the river and caught nothing except a duck. He found out, too, the reason for the name "Baptism"—he string a speckled trout that beat anything I ever saw; he

found out, too the reason for the name "Baptism"—he was thoroughly immersed. That morning we started for home, and of the trials and triumphs, the joys and sorrows of that homeward voyage I will speak in my next.

Big Bass.—Putnum, Ang. 29th.—Some eight miles from here lies the famous Webster Pond, which is very large, covering some 2,000 acres or more, and abounds in black bass, some very large, yet we do not know just how to catch them. Dobson and worms are principally used, but while we can see hundreds of great fellows swim past our hooks, they searcely notice our bait. Once in a while one will notice, and perhaps bite, and while we catch only from five to twenty in a day's fishing, it seems, if we only knew the proper bait, we might catch hundreds where we catch but one now. Will some one let us know through the FOREST AND STREAM of the best bait, or indeed tell us how to catch some of these big fellows. or indeed tell us how to catch some of these big fellows. There seems to be an abundance of food for fish in this pond, for shiners, perch and pickerel also abound. This lake, or pond, is of an average of say twelve feet deep. (3. F. W.

CHICAGO .- We would certainly not advise you to try the Perkins boiler. It is complicated, and not any more economical than kins boiler. It is complicated, and not any more economical than the common tubular boiler. Do not believe the statements put forth by interested bucksters in "rights" for America. Examine the trials in England and convince yourself. The boiler has now been in the market for ten years, and only half a dozen are in use, while many have been thrown out as worthless humburs. With your soft coals the Perkins boiler would be an absolute nuisance and wasteful in fuel. See back files,

W. C., East Suginaw.—Taking boat at twenty-five feet water line, eight and a half feet beam, and four feet nine inches d. ep she will need three and a half to four thous ballast. Of this put say 1,575 pounds in the keel. Latter about fifteen inches below garboards amidships, eight inches on top and five inches on bottom, tapering at ends. Round up well forward and alltid at The iron outside will be ten feet long and ten inches deep; average thickness, six inches. The keelson can be cast-iron if desired, and rest stowed between the frames under the floor or cast to fit. See that it is secured and cannot shift. Can away the keel for the See that it is secured and cannot shift. Cut away the keel for the outside iron, and bolt up through all. The midship section you outside four and not up inforged all. The finishing section you send will make a very roomy craft. Give sides of house a slight, "tumble home." Mast for compromise cutter about nine feet sk inches from forward end of water line. Forestay sets up at stom head; jibstay through bowsprit end and down to cuttwater. Use head; jibstay through bowsprit end and down to cutwater. Use tixed bowsprit and standing jib. Holist of minsul, twenty feet boom twenty-seven and a half feet, gaif lifteen feet, bowsprit outboard twelve feet. Peak gaif with jibsiay, or nearly so. Topmast fourteen feet above cap, fitted to house. Exact sail plan depends upon immersed fore and aft section. Center of sails about six inches forward of center of lateral resistance. Several such boats in our waters, giving much more satisfaction than the pancake variety.

T. E. K., Bradford, Pa.-I have a Sussex cocker puppy three or The R., Biantout, "A."—I have a classes coher pupy in one or four months oil. About two weeks ago he showed signs of being out of order. His hair appeared to be dead and dry; sores showed themselves on different parts of his body and his cyes ran badly. I gave him two drops of Fowler's solution daily, and also gave him an occasional dose of sulphur in his milk. Do not think gave him an occasional dose of sulphur in his milk. Do not think the came from overfeeding or high living. He did not seem to im-prove under this treatment, and last Sunday he showed Indica-tions of what I supposed was distemper, though I never saw a case and have had no experience with the disease. He had spasms, during which be threw a frothy slime from his mouth. spassas, suring when he lines a river is smaller from his mouth. I have been giving a mixture of oream of tartar, subjurrant gunpowder, one teaspoonful once or twice a day and two drops tincture nux vomica. On Friday, his symptoms were more alarming. He would run around in his room and bite things that cause in He would run around in his room and bite things that came in his way, agd I feared he might have sizes of being rabid and intended having him killed; but this morning he does not show these wild signs and recognizes his friends. He eats heartily. We feed him on boiled milk and bread, with some cooked meat. He has an almost constant twitching of the moscles, but I do not think his eyes are runnin gos onuch now. Ans. The dog requires to be very closely watched. The symptoms given point very strongly to rabies, although it is seldom that the disease appears in one so young, unless bitten by a rabid animal. Write again.

#### PUBLISHERS' DEPARTMENT.

A REMARKABLE CIRCUMSTANCE.—Mr. W. E. Sanford, of Holley, N. Y., became afflicted a few years since with a most terrible in-dammation in the lower portion of his body. He did all that thought could suggest to remove it, even submitting to a most painful surgical operation. At last, when death was longed for and seemed near, be began (against the wishes of his friends) tak-ing Warner's Safe Kidney and Liver Cure, and is to-day a strong man and in perfect health. Any readers who may question this remarkable assertion can address him at Holley, N. Y., and as certain for themselves

CATALOGUE OF HAMMERLESS GUNS .-- Messrs. J. Palmer O'Neil & Co. have recently forwarded to us a copy of their new catalogue of Hammerless Guns, a publication which is devoted to showing the character of the sportsman's goods now for sale by them. It is profusely illustrated with fine woodcuts, and seems to mention every article that the shooting man can require. In addition to the pages devoted purely to business are several which include in their contents the game laws of Pennsylvania, abstracts of those of most of the States and Territories, and a number of useful hints to sportsmen

THE WILSON ADJUSTABLE CHAIR.—The attention of every one of our readers, be he bachelor or family man, is particularly directed to the advertisement on another page of this paper of the Wilson Adjustable Chair. This is an article of real merit. Through its wonderful adaptability it really takes the place of from \$300 to \$100 worth of indexible beds, chairs and lounges. It is an elegant addition to parlor or library. There are chairs and chairs, but this is the chair. Many casy chair-makers have done excellently, but the Wilson has excelled them all.

-The Holabird Shooting and Fishing Suits. Upthegrove & McClellan so's manufacturers, Valparaiso, Ind. Send for circular. O' The 'Holabird Shooting Coat' the best in the world."

-Try Diving Decoys and Improved Explosive Target Balls See advertisement.

Our readers will do well to notice the new advertisement of E. Remington & Sons.

-The American Arms Company, as explained by their new advertisement, will reduce the prices on their guns for a short time. Send in your order if you want to get a good Fox gun

#### TORONTO DOG SHOW.

ceasion were deep and roomy, but they were too him some the ground—a common fault in our bench shows—and the lifting of large dogs on to high benches is a difficult and sometimes a dangerous task. They should be no higher than eighteen inches from the floor; then a dog can get up and down without assistance. Taken as a whole, we were much pleased with the general arrangements, though the feeding on the first day, at least, was not what it should have been, the promised supply of Spratt's biscuit not having arrived, unfortunately, while the waste food from the dining hall was not enough for the demand, and the quality poor. Of the dogs on exhibition the majority of the sporting classes were not up to the average, though they contained some good ones here and there. From this general statement we must except foxhounds and greyhounds, they being very strong classes, particularly the former. The non-sporting division, which rightly for this country, we think, included fox terriers, were well ahead of anything seen on this continent, the prize wimers being, with hardly an exception, superior to those at the late Westminster Kennel Show. Judging was done single handed and in public, the task being divided up as follows: Mr. John Davidson took setters, pointers, spaniels, retrievers, foxhounds, beagles, and greyhounds; Dr. J. S. Niven took colleys, black and tan terriers, pugs and toys, and Mr. James Watson took mastiffs, St. Bernards, Newfoundlands, bulldogs, bull terriers, shug dandied immont terriers, and rough terriers. The duties being thus subdivided, enabled the whole work to be finished early on the afternoon of the first day; indeed, with the exception of the special prizes, the judging was finished before an adjournment was made tor lunch.

EKGLISH SETTERS.—In the absence of Prince of Orange, who, we underestand, has left Mr. Wilks' kennel, Dime, who, we underestand, has left Mr. Wilks' kennel, Dime

made for lunch.

ENGLISH SETTERS.—In the absence of Prince of Orange, who, we understand, has left Mr. Wilks' kennel, Dime, a very handsome black and white ticked dog, had an easy win. He is only fourteen months old, by Flash ex Whirlwind, and a litter sister took first honors in the litch class. Both are the property of Mr. Francis, of Rochester, and they make an uncommonly well-matched trace, making allowance for the difference in size for sex. Bang, the second dog, is a big bony fellow, with very little fashion. Sport is very plain, and Forrest very weak in head; his condition pulled him forward. Paris was sent on exhibition in his working suit, and the old fellow was a model even without his bench show allowance of feather, etc. In bitches, Flame, referred to above, won well. Princess Blancho is passable and no more, and but for her small bone basis would doubtless have changed places with her. Medina was hardly deserving of a card, being almost devoid of feather. Indeed, we cannot compliment Mr. Weighell on the condition of any of his dogs. Pride took first in the puppy class. He was not to our fancy at all; size he has, but his faulty head is just about on a par with his temper. Mr. Davidson, we think, was not aware of the rule respecting the powers and duties of the judges in giving prizes only according to merit when there were less than four entres in a class. This is not mentioned with par ficuary reference to this class, but all through the piece he gave firsts and seconds irrespective of the entry list.

Halst, —Three poor ones in dogs. Rattus, Jr., short in cont but of good color, scored first from the light-eyed Grouse, who also is very faulty in head, while Shell, a half-bred English setter, was commended with all his English Setters.—In the absence of Prince of Orange

white. Jean, the winning bitch, is a good one all over, and being entered at \$40, was quickly snapped up. Breeze was not in show form, and Belle crowded her pretty well

was not in show form, and Beile crowded her pretty well for second place. Puppies were a moderate pair, the best one getting the award.

Gondon.—Blosson, of course, won without a struggle in such company, the second, Don, being a sour-headed fellow, though of good shape and with plenty of style. Major we did not fancy for V. H. C., preferring the black white and tan Tuck to the Toronto dog. The four bitches were cerrectly placed. Mollie is light and rangy for a Gordon. May shows age, and no wonder, seeing that she is 'rising nine." Gyp is too flat in skull, and Moll III. bad in tam. Argus was the only good puppy.

Pointries.—Dick, first in dogs, is thick and short, but his good head and bone carried him to the front in a moderate class. Dash carries his ears so badly that his head is disfigured; otherwise he is a nicely proportioned dog, and earned his place. Grouse did not look up to the mark, and Sandy is a plain dog. Bitches were better than dogs, Gypsey being the best in the two classes, and a cheap bitch at her catalogued price of \$50. Fan, the mother of the litter of seventeen (seven were with her in the pen), showed the effects of her maternal duties, or probably she would have been placed second, for Gip, who got that card, is no flyer. In puppies, Puper, eight necks old, took first; that says sufficient for the other two entries.

who got that card, is no Hyer. In pupples, ruper, eigentrecks old, took first; that says sufficient for the other two entries.

COCKERS.—Here, to our mind, Mr. Davidson got astray. First in dogs was a curly-coated black—a coat like a curly-coated English retriever, and in the absence of any testimony to the contrary we fancy his dam must at least have been chased by a dog of that description. Dash should have been first and Rollo second, and then, when it came to the special between Dash and Busy, the winning bitch, it would have been a close thing. As it was, when Busy and Crow came out for Mr. Brough's ten dollar bill it was any odds on the bitch. She is a model cocker, but a little more ear would add to her taking appearance. Putting Madcap in front of Cora for second place will cause their youthful owner to forget all Mr. Datziel's transgressions in the punguage of this new set lack. Rose merited her V. H. C., though she has too much daylight under her.

CLUMBER.—Duke, a weak-headed dog, walked over for first.

Sussex.—No prize should have been given in this class.
